支持高达 50mA/200mA 输出电流的可编程输出电压超低功耗降压转换器

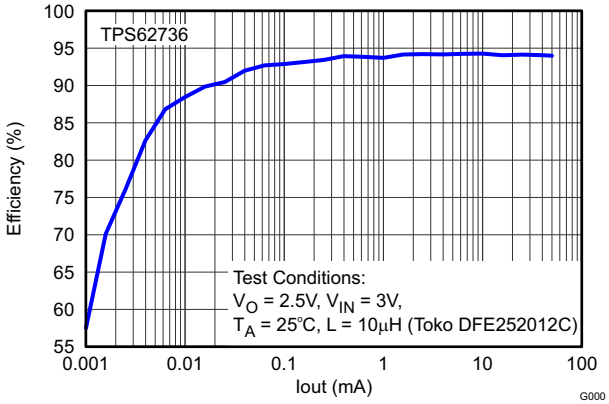
查询样品: TPS62736, TPS62737

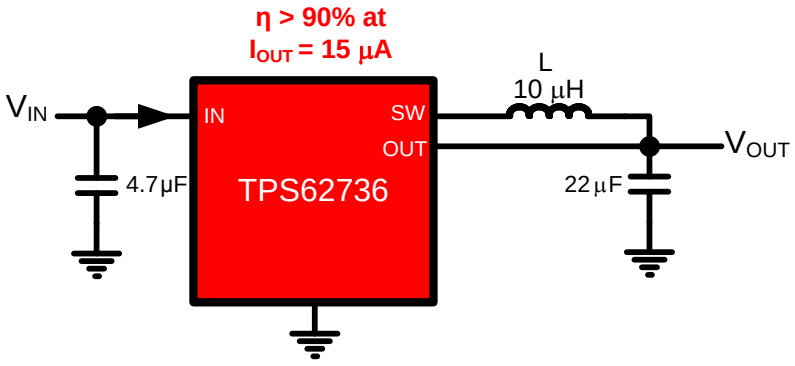
特性

- 低输出电流方面行业最高效率：$I_{输出}$= 15μA 时大于 90%
- 超低功耗降压转换器
  - TPS62736 针对 50mA 输出电流进行了优化
  - TPS62737 针对 200mA 输出电流进行了优化
  - 1.3V-5V 电阻器可编程输出电压范围
  - 2V-5.5V 输入工作范围
  - 对于 TPS62736/TPS62737，有源运行期间，380nA/375nA 的静态电流
  - 出厂模式运行期间，10nA 静态电流
  - 2% 电压调节精度
- 100% 占空比（直通模式）
- EN1 和 EN2 控制
  - 两个断电状态：
    - 1) 出厂模式（完全断电状态）
    - 2) 包括 VIN_OK 指示在内的待机模式
- 输入电源正常指示 (VIN_OK)
  - 推挽驱动器
  - 电阻器可编程阀值电平

应用范围

- 超低功耗应用
- 2 节和 3 节碱性电池供电类应用
- 能量采集
- 太阳能充电器
- 热电发电机 (TEG) 能量采集
- 无线传感器网络 (WSN)
- 低功耗无线监测
- 环境监测
- 桥梁和结构健康监测 (SHM)
- 智能楼宇控制
- 便携式和可佩戴式健康器件
- 娱乐系统遥控





These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

说明

TPS6273X 系列提供了一个高度集成的超低功耗降压转换器解决方案，此解决方案非常适合于满足诸如能量采集等超低功耗应用的特殊需要。 为了保持与一个线性降压转换器相对的电源管理级的总体效率，TPS6273X 提供具有一个外部可编程经稳压电源的系统。 为了给低压电子器件供电，这个稳压器用于将来自诸如电池或者超大电容器等储能元件的电压降低。 为了在整个低输出电流 (<10μA) 到高电流 (200mA) 的转换过程中提供高效率，已经对经稳压的输出进行了优化。

TPS6273X 集成了一个针对低功耗应用的已优化的滞后控制器。 为了减少平均静态电流，内部电路采用一个基于时间的采样系统。

为了帮助用户进一步严格管理他们的能耗预算，当输入电源上的电压已经下降到低于一个预先设定的关键电平以下时，TPS6273X 切换输入正常指示器，向一个已连接的微控制器发出一个信号。 这个信号用于触发负载电流衰减，以防止系统进入一个欠压条件。 还有独立使能信号来使系统能够控制转换器是否调节输出，还是只监视输入电压，或者在超低静态睡眠状态中关断。

输入正常阀值和输出稳压器电平是由外部电阻器独立设定的。

TPS6273X 的全部功能被封装在一个小封装尺寸 14 接线 3.5mm x 3.5mm 四方扁平无引线 (QFN) 封装。

ORDERING INFORMATION

T_A	PART NO.	OUTPUT VOLTAGE	MAX OUTPUT CURRENT	INPUT UVLO	ORDERING NUMBER (TAPE AND REEL)	PACKAGE MARKING	QUANTITY
–40°C to 85°C	TPS62736(1)	Resistor Programmable	50 mA	2 V	TPS62736RGYR	TPS62736	3000
					TPS62736RGYT		250
–20°C to 85°C	TPS62737(1)	Resistor Programmable	200 mA	2V	TPS62737RGYR	TPS62737	3000
					TPS62737RGYT		250

(1) The RGY package is available in tape on reel. Add R suffix to order quantities of 3000 parts per reel, T suffix for 250 parts per reel.

ABSOLUTE MAXIMUM RATINGS(1)

over operating free-air temperature range (unless otherwise noted)

			VALUE(2)		UNIT
			MIN	MAX	
	Pin voltage	Input voltage range on IN, EN1, EN2, VRDIV, VIN_OK_SET, VOUT_SET, VIN_OK, OUT, SW,NC	–0.3	5.5	V
TPS62736	Peak currents	IN, OUT		100	mA
TPS62737	Peak currents	IN, OUT		370	mA
T_J	Temperature range	Operating junction temperature range	–40	125	°C
T_{STG}		Storage temperature range	–65	150	°C
ESD(3)	Human Body Model - (HBM)			1	kV
	Machine Model (MM)			150	V
	Charge Device Model - (CDM)			500	V

(1) Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to VSS/ground terminal
(3) ESD testing is performed according to the respective JESD22 JEDEC standard.

THERMAL INFORMATION

THERMAL METRIC(1)		RGY	UNITS
		14-Pins	
θ_{JA}	Junction-to-ambient thermal resistance	33.7	°C/W
θ_{JCtop}	Junction-to-case (top) thermal resistance	37.6	
θ_{JB}	Junction-to-board thermal resistance	10.1	
ψ_{JT}	Junction-to-top characterization parameter	0.4	
ψ_{JB}	Junction-to-board characterization parameter	10.3	
θ_{JCbot}	Junction-to-case (bottom) thermal resistance	2.9	

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, SPRA953.

RECOMMENDED OPERATING CONDITIONS

		MIN	NOM	MAX	UNIT
IN	IN voltage range	2		5.5	V
C_{IN}	TPS62736 Input Capacitance	4.7			µF
	TPS62737 Input Capacitance	22			
C_{OUT}	Output Capacitance	10	22		µF
$R_1 + R_2 + R_3$	Total Resistance for setting reference voltage		13		MΩ
L_{BUCK}	TPS62736 Inductance	4.7	10		µH
	TPS62737 Inductance	10			
T_A	TPS62736 Operating free air ambient temperature	–40		85	°C
	TPS62737 Operating free air ambient temperature	–20		85	
T_J	Operating junction temperature	–40		105	°C

ELECTRICAL CHARACTERISTICS

Over recommended ambient temperature range, typical values are at T_A = 25°C. Unless otherwise noted, specifications apply for conditions of V_{IN} = 4.2 V, V_{OUT} = 1.8 V External components, C_{IN} = 4.7 µF for TPS62736 and 22 µF for TPS62737 , L_{BUCK} = 10 µH, C_{OUT} = 22 µF

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
QUIESCENT CURRENTS						
I_Q	TPS62736 Buck enabled state (EN1 = 0, EN2 = 1)	V_{IN} = 2 V, No load on V_{OUT}		380	550	nA
	TPS62736 Buck disabled VIN_OK active state (EN1 = 0, EN2 = 0)			340	520	
	TPS62736 Ship mode state (EN1 = 1, EN2 = x)			10	65	
	TPS62737 Buck enabled state (EN1 = 0, EN2 = 1)			375	600	nA
	TPS62737 Buck disabled VIN_OK active state (EN1 = 0, EN2 = 0)			345	560	
	TPS62737 Ship mode state (EN1 = 1, EN2 = x)			11	45	

ELECTRICAL CHARACTERISTICS (continued)

Over recommended ambient temperature range, typical values are at T_A = 25°C. Unless otherwise noted, specifications apply for conditions of V_{IN} = 4.2 V, V_{OUT} = 1.8 V External components, C_{IN} = 4.7 µF for TPS62736 and 22 µF for TPS62737 , L_{BUCK} = 10 µH, C_{OUT} = 22 µF

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
OUTPUT						
V_{BIAS}	Output regulation reference		1.205	1.21	1.217	V
V_{OUT}	TPS62736 Output regulation (*Spec does not include the resistor accuracy error*)	I_{OUT} = 10 mA; 1.3 V < V_{OUT} < 3.3 V	–2%	0%	2%	
	TPS62737 Output regulation (*Spec does not include the resistor accuracy error*)	I_{OUT} = 100 mA; 1.3 V < V_{OUT} < 3.3 V;	–2%	0%	2%	
	TPS62736 Output line regulation	I_{OUT} = 100 µA; V_{IN} = 2.4 V to 5.5 V		0.01		%/V
	TPS62737 Output line regulation	I_{OUT} = 10 mA; V_{IN} = 2.3 V to 5.5 V		0.31		
	TPS62736 Output load regulation	I_{OUT} = 100 µA to 50 mA, V_{IN} = 2.2 V		0.01		%/mA
	TPS62737 Output load regulation	I_{OUT} = 100 µA to 200 mA, V_{IN} = 2.2 V; -20 °C < T_A < 85°C		0.01		%/mA
	TPS62736 Output ripple	V_{IN} = 4.2V, I_{OUT} = 1 mA, C_{OUT} = 22 µF		20		mVpp
	TPS62737 Output ripple	V_{IN} = 4.2V, I_{OUT} = 1 mA, C_{OUT} = 22 µF		40		mVpp
	Programmable voltage range for output voltage threshold	I_{OUT} = 10 mA	1.3		V_{IN} - 0.2	V
V_{DO}	TPS62736 Drop-out-voltage when V_{IN} is less than $V_{OUT(SET)}$	V_{IN} = 2.1 V, $V_{OUT(SET)}$ = 2.5 V, I_{OUT} = 10 mA, 100% duty cycle		24	30	mV
	TPS62737 Drop-out-voltage when V_{IN} is less than $V_{OUT(SET)}$	V_{IN} = 2.1 V, $V_{OUT(SET)}$ = 2.5 V, I_{OUT} = 100 mA, 100% duty cycle		180	220	mV
$t_{START-STBY}$	Startup time with EN1 low and EN2 transition to high (Standby Mode)	TPS62736, C_{OUT} = 22 µF		400		µs
		TPS62737, C_{OUT} = 22 µF		300		µs
$t_{START-SHIP}$	Startup time with EN2 high and EN1 transition from high to low (Ship Mode)	C_{OUT} = 22 µF		100		ms
POWER SWITCH						
$R_{DS(on)}$	TPS62736 High side switch ON resistance	V_{IN} = 3 V		2.4	3	Ω
	TPS62736 Low side switch ON resistance	V_{IN} = 3 V		1.1	1.5	Ω
	TPS62737 High side switch ON resistance	V_{IN} = 2.1 V		1.8	2.2	Ω
	TPS62737 Low side switch ON resistance	V_{IN} = 2.1 V		0.9	1.3	Ω
I_{LIM}	TPS62736 Cycle-by-cycle current limit	2.4 V < V_{IN} < 5.25 V; 1.3 V < V_{OUT} < 3.3 V	68	86	100	mA
	TPS62737 Cycle-by-cycle current limit	2.4 V < V_{IN} < 5.25 V; 1.3 V < V_{OUT} < 3.3 V; -20 °C < T_A < 85°C	295	340	370	mA
f_{SW}	Max switching frequency			2		MHz
INPUT						
$V_{IN-UVLO}$	Input under voltage protection	V_{IN} falling	1.91	1.95	2	V
V_{IN-OK}	Input power good programmable voltage range		2		5.5	V
$V_{IN-OK-ACC}$	TPS62736 Accuracy of V_{IN-OK} setting	V_{IN} increasing	-2		2	%
	TPS62737 Accuracy of V_{IN-OK} setting		-3		3	
$V_{IN-OK-HYS}$	Fixed hysteresis on VIN_OK threshold, OK_HYST	V_{IN} increasing		40		mV
V_{IN_OK-OH}	V_{IN-OK} output high threshold voltage	Load = 10 µA	V_{IN} - 0.2			V
V_{IN_OK-OL}	V_{IN-OK} output low threshold voltage				0.1	V
EN1 and EN2						
V_{IH}	Voltage for EN High setting. Relative to V_{IN}	V_{IN} = 4.2V	V_{IN} - 0.2			V
V_{IL}	Voltage for EN Low setting.				0.2	V

DETAILED PRINCIPLE OF OPERATION

Step Down (Buck) Converter Operation

The buck regulator in the TPS6273X takes input power from VIN, steps it down and provides a regulated voltage at the OUT pin. It employs pulse frequency modulation (PFM) control to regulate the voltage close to the desired reference voltage. The reference voltage is set by the user programmed resistor divider. The current through the inductor is controlled through internal current sense circuitry. The peak current in the inductor is controlled to maintain high efficiency of the converter across a wide input current range. The TPS62736 converter delivers an average output current of 50mA with a peak inductor current of 100 mA. The TPS62737 converter delivers an average output current of 200 mA with a peak inductor current of 370 mA.The buck regulator is disabled when the voltage on VIN reaches the UVLO condition. The UVLO level is continuously monitored. The buck regulator continues to operate in pass (100% duty cycle) mode, passing the input voltage to the output, as long as VIN is greater than UVLO and less than VIN minus I_{OUT} times $R_{DS(on)}$ of the high-side FET (i.e., VIN - I_{OUT} x $R_{DS(on)-HS}$). In order to save power from being dissipated through other IC's on this supply rail while allowing for a faster wake up time, the buck regulator can be enabled and disabled via the EN2 pin for systems that desire to completely turn off the regulated output.

Nano-Power Management and Efficiency

The high efficiency of the TPS6273X is achieved via the proprietary Nano-Power management circuitry and algorithm. This feature essentially samples and holds all references in order to reduce the average quiescent current. That is, the internal circuitry is only active for a short period of time and then off for the remaining period of time at the lowest feasible duty cycle. A portion of this feature can be observed in Figure 34 where the VRDIV node is monitored. Here the VRDIV node provides a connection to the input (larger voltage level) and generates the output reference (lower voltage level) for a short period of time. The divided down value of input voltage is compared to VBIAS and the output voltage reference is sampled and held to get the VOUT_SET point. Since this biases a resistor string, the current through these resistors is only active when the Nano-Power management circuitry makes the connection—hence reducing the overall quiescent current due to the resistors. This process repeats every 64 ms. Similarly,the VIN_OK level is monitored every 64ms, as shown in Figure 67.

The efficiency versus output current and versus input voltage are plotted for three different output voltages for both the TPS62736 and TPS62737 in the Typical Characteristics section. All data points were captured by averaging the overall input current. This must be done due to the periodic biasing scheme implemented via the Nano-Power management circuitry. The input current efficiency data was gathered using a source meter set to average over at least 25 samples and at the highest accuracy sampling rate. Each data point takes a long period of time to gather in order to properly measure the resulting input current when calculating the efficiency.

Programming OUT Regulation Voltage and VIN_OK

To set the proper output regulation voltage and input voltage power good comparator, the external resistors must be carefully selected. Figure 1 illustrates an application diagram which uses the minimal resistor count for setting both VOUT and VIN_OK. Note that VBIAS is nominally 1.21V per the electrical specification table. Referring to Figure 1, the OUT dc set point is given by:

$$VOUT = VBIAS\left(\frac{R_1 + R_2 + R_3}{R_1 + R_2}\right) \quad (1)$$

The VIN_OK setting is given by:

$$VIN\_OK = VBIAS\left(\frac{R_1 + R_2 + R_3}{R_1}\right) \quad (2)$$

The sum of the resistors is recommended to be no greater than 13 MΩ , that is, RSUM = R1 + R2 + R3 = 13 MΩ. Due to the sampling operation of the output resistors, lowering RSUM only increases quiescent current slightly as can be seen in Figure 26. Higher resistors may result in poor output voltage regulation and/or input voltage power good threshold accuracies due to noise pickup via the high impedance pins or reduction of effective resistance due to parasitic resistances created from board assembly residue. See Layout Considerations section for more details.

If it is preferred to separate the VOUT and VIN_OK resistor strings, two separate strings of resistors could be used as shown in Figure 3. The OUT dc set point is then given by Equation 3:

$$VOUT = VBIAS\left(\frac{R_3 + R_4}{R_4}\right) \quad (3)$$

The VIN_OK setting is then given by Equation 4:

$$VIN\_OK = VBIAS\left(\frac{R_1 + R_2}{R_1}\right) \quad (4)$$

If it is preferred to disable the VIN_OK setting, the VIN_OK_SET pin can be tied to VIN as shown in Figure 4. To set VOUT in this configuration, use Equation 3. To tighten the dc set point accuracy, use external resistors with better than 1% resistor tolerance. Since output voltage ripple has a large effect on input line regulation and the output load regulation, using a larger output capacitor will improve both line and load regulation.

Enable Controls

There are two enable pins implemented in the TPS6273X in order to maximize the flexibility of control for the system. The EN1 pin is considered to be the chip enable. If EN1 is set to a 1 then the entire chip is placed into ship mode. If EN1 is 0 then the chip is enabled. EN2 enables and disables the switching of the buck converter. When EN2 is low, the internal circuitry remains ON and the VIN_OK indicator still functions. This can be used to disable down-stream electronics in case of a low input supply condition. When EN2 is 1, the buck converter operates normally.

Table 1. Enable Functionality Table

EN1 PIN	EN2 PIN	FUNCTIONAL STATE
0	0	Partial standby mode. Buck switching converter is off, but VIN_OK indication is on
0	1	Buck mode and VIN_OK enabled
1	x	Full standby mode. Switching converter and VIN_OK indication is off (ship mode)

Startup Behavior

The TPS6273X has two startup responses: 1) from the ship-mode state (EN1 transitions from high to low), and 2) from the standby state (EN2 transitions from low to high). The first startup response out of the ship-mode state has the longest time duration due to the internal circuitry being disabled. This response is shown in Figure 38 for the TPS62736 and Figure 72 for the TPS62737. The startup time takes approximately 100ms due to the internal Nano-Power management circuitry needing to complete the 64 ms sample and hold cycle.

Startup from the standby state is shown in Figure 39 for the TPS62736 and Figure 73 for the TPS62737. This response is much faster due to the internal circuitry being pre-enabled. The startup time from this state is entirely dependent on the size of the output capacitor. The larger the capacitor, the longer it will take to charge during startup. The TPS6273X can startup into a pre-biased output voltage.

Steady State Operation and Cycle by Cycle Behavior

The steady state operation at full load is shown in Figure 31 for the TPS62736 and Figure 66 for TPS62737. This plot highlights the inductor current waveform, the output voltage ripple, and the switching node. The output voltage is maintained by charging and discharging the output capacitor at a primary duty cycle (major frequency) which in turn dictates the output voltage ripple frequency. When VOUT is increasing in value, the output capacitor is charged by the hysteretic buck controller. This is achieved by controlling the peak cycle-by-cycle inductor current to I_{LIM}. The cycle-by-cycle current is maintained by turning on and off the high side FET at a secondary duty cycle (minor frequency). When VOUT reaches a peak value, all hysteretic control is disabled until a minimum value is reached. The rate at which the converter stays off is dictated by the load and the size of the output capacitor. At heavier output loads (larger output current), the time the converter is off is smaller when compared to light load conditions. The light load condition is shown in Figure 32 for the TPS62736 and Figure 65 for the TPS62737. Note that the converter is inactive for a longer period of time when compared to the active time.

The minor switching frequency is of concern when choosing the inductor. This maximum switching frequency is 1 MHz. The major switching frequency dictates the voltage ripple frequency. Figure 27 and Figure 28 show the major switching frequency versus load current and input voltage for the TPS62736, respectively. Figure 61 and Figure 62 show the major switching frequency versus load current and input voltage for the TPS62737, respectively.

Inductor Selection

The internal control circuitry is designed to control the switching behavior with a nominal inductance of 10 µH ± 20%. The inductor's saturation current should be at least 25% higher than the maximum cycle-by-cycle current limit per the electrical specs table (I_{LIM}) in order to account for load transients. Since this device is a hysteretic controller, it is a naturally stable system (single order transfer function). However, the smaller the inductor value is, the faster the switching currents are. The speed of the peak current detect circuit sets the TPS62736 inductor's lower bound to 4.7 µH. When using a 4.7 µH, the peak inductor current will increase when compared to that of a 10 µH inductor. The steady-state operation with a 4.7 µH inductor with a 50 mA load for the TPS62736 is shown in Figure 33.

A list of inductors recommended for this device is shown in Table 2.

Table 2.

Inductance (µH)	Dimensions (mm)	Part Number	Manufacturer
10	2.0 x 2.5 x 1.2	DFE252012C-H-100M	Toko
10	4.0x4.0x1.7	LPS4018-103M	Coilcraft
4.7 (TPS62736 only)	2.0 x 2.5 x 1.2	DFE252012R-H-4R7M	Toko

Output Capacitor Selection

The output capacitor is chosen based on transient response behavior and ripple magnitude. The lower the capacitor value, the larger the ripple will become and the larger the droop will be in the case of a transient response. It is recommended to use at least a 22 µF output capacitor for most applications.

Input Capacitor Selection

The bulk input capacitance is recommended to be a minimum of 4.7 µF ± 20% for the TPS62736 and 22 µF ± 20% for the TPS62737. This bulk capacitance is used to suppress the lower frequency transients produced by the switching converter. There is no upper bound to the input bulk capacitance. In addition, a high frequency bypass capacitor of 0.1 µF is recommended in parallel with the bulk capacitor. The high frequency bypass is used to suppress the high frequency transients produced by the switching converter.

Layout and PCB Assembly Considerations

To minimize switching noise generation, the step-down converter (buck) power stage external components must be carefully placed. The most critical external component for a buck power stage is its input capacitor. The bulk input capacitor (C_{IN1}) and high frequency decoupling capacitor (C_{IN2}) must be placed as close as possible between the power stage input (IN pin 1) and ground (VSS pin 12). Next, the inductor (L1) must be placed as close as possible beween the switching node (SW pin 13) and the output voltage (OUT pin 11). Finally, the output capacitor (C_{OUT}) should be placed as close as possible between the output voltage (OUT pin 11) and GND (VSS pin 12). In the diagram below, the input and output capacitor grounds are connected to VSS pin 12 through vias to the PCB's bottom layer ground plane.

To minimize noise pickup by the high impedance voltage setting nodes (VIN_OK_SET pin 8 and VOUT_SET pin 9), the external resistors (R1, R2 and R3) should be placed so that the traces connecting the midpoints of the string are as short as possible. In the diagram below, the connection to VOUT_SET is by a bottom layer trace.

The remaining pins are either NC pins, that should be connected to the PowerPAD™ as shown below, or digital signals with minimal layout restrictions.

In order to maximize efficiency at light load, the use of voltage level setting resistors > 1MΩ is recommended. However, during board assembly, contaminants such as solder flux and even some board cleaning agents can leave residue that may form parasitic resistors across the physical resistors and/or from one end of a resistor to ground, especially in humid, fast airflow environments. This can result in the voltage regulation and threshold levels changing significantly from those expected per the installed resistor values. Therefore, it is highly recommended that no ground planes be poured near the voltage setting resistors. In addition, the boards must be carefully cleaned, possibly rotated at least once during cleaning, and then rinsed with de-ionized water until the ionic contamination of that water is well above 50 MOhm. If this is not feasible, then it is recommended that the sum of the voltage setting resistors be reduced to at least 5X below the measured ionic contamination.

TPS62737RGYT	NRND	VQFN	RGY	14	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	0 to 0	62737	

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

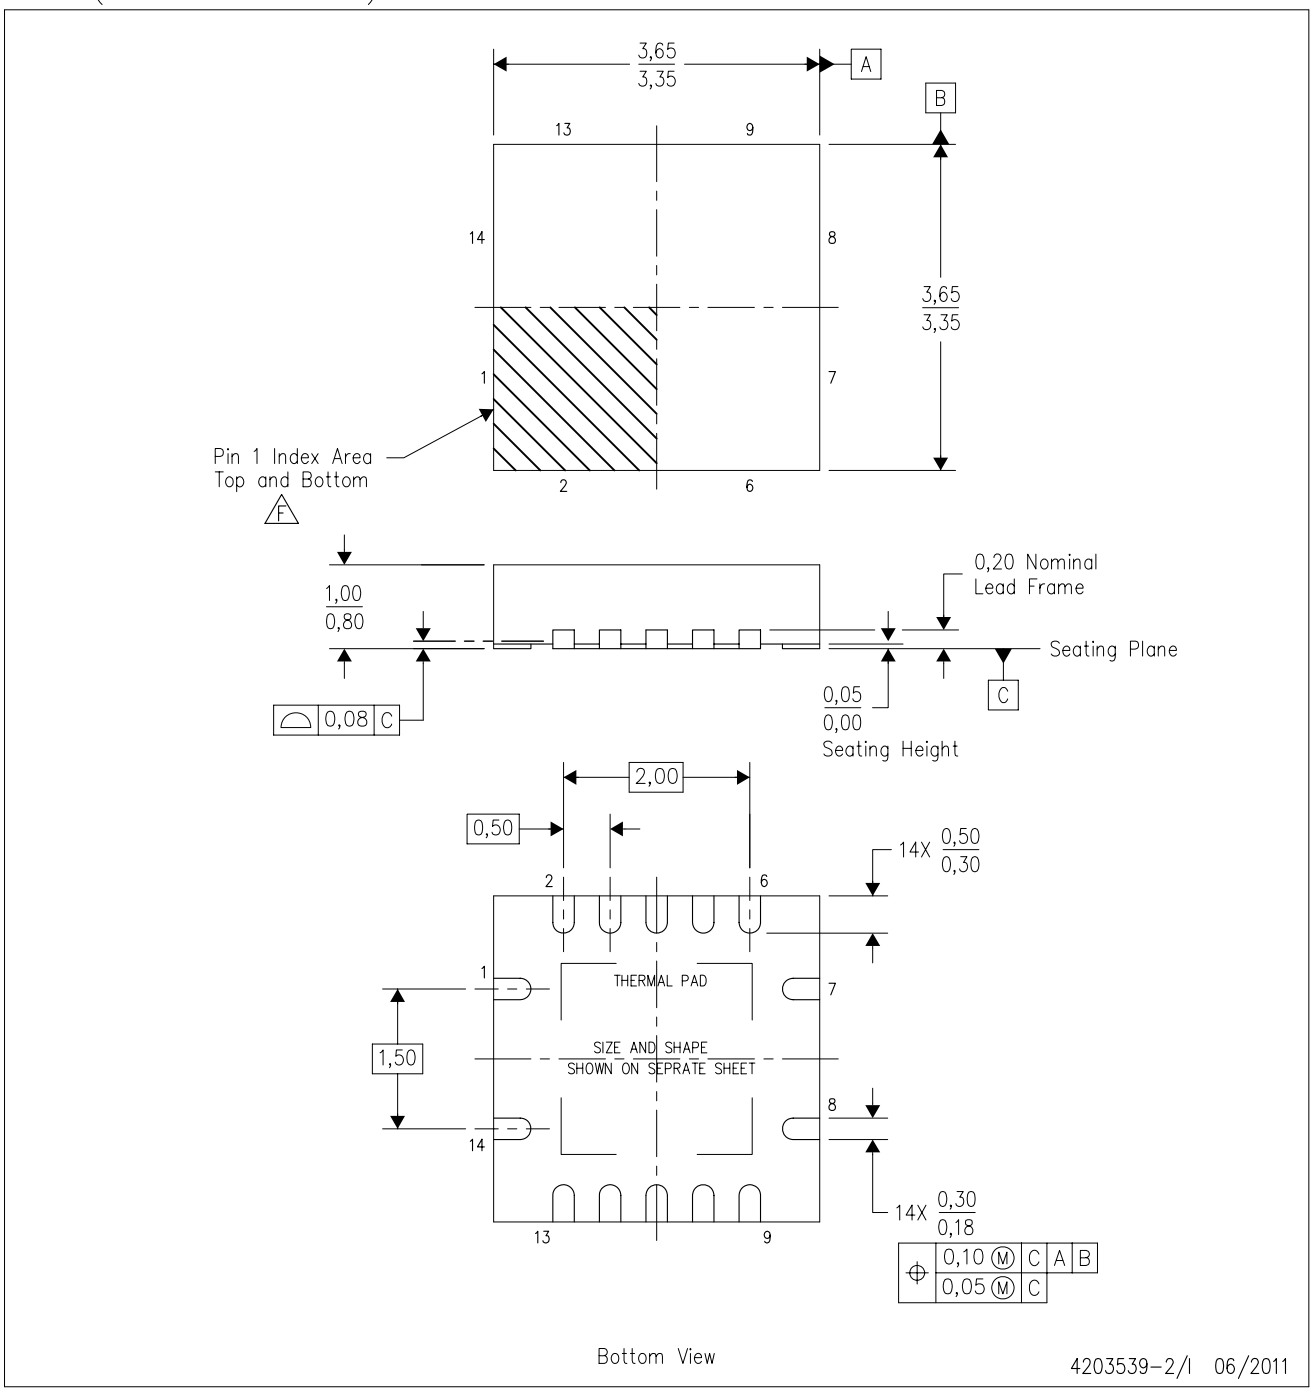
RGY (S–PVQFN–N14) PLASTIC QUAD FLATPACK NO–LEAD



NOTES:
A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M–1994.
B. This drawing is subject to change without notice.
C. QFN (Quad Flatpack No–Lead) package configuration.
D. The package thermal pad must be soldered to the board for thermal and mechanical performance.
E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
F. Pin 1 identifiers are located on both top and bottom of the package and within the zone indicated. The Pin 1 identifiers are either a molded, marked, or metal feature.
G. Package complies to JEDEC MO–241 variation BA.

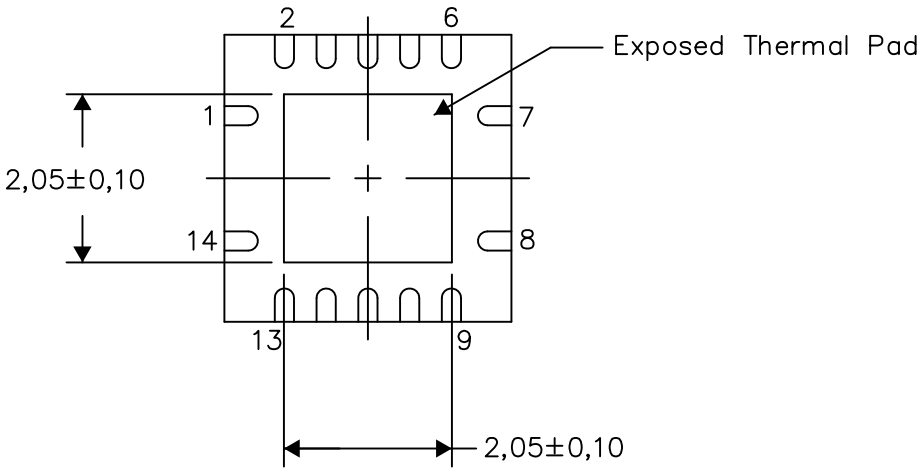
RGY (S–PVQFN–N14) PLASTIC QUAD FLATPACK NO–LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No–Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.



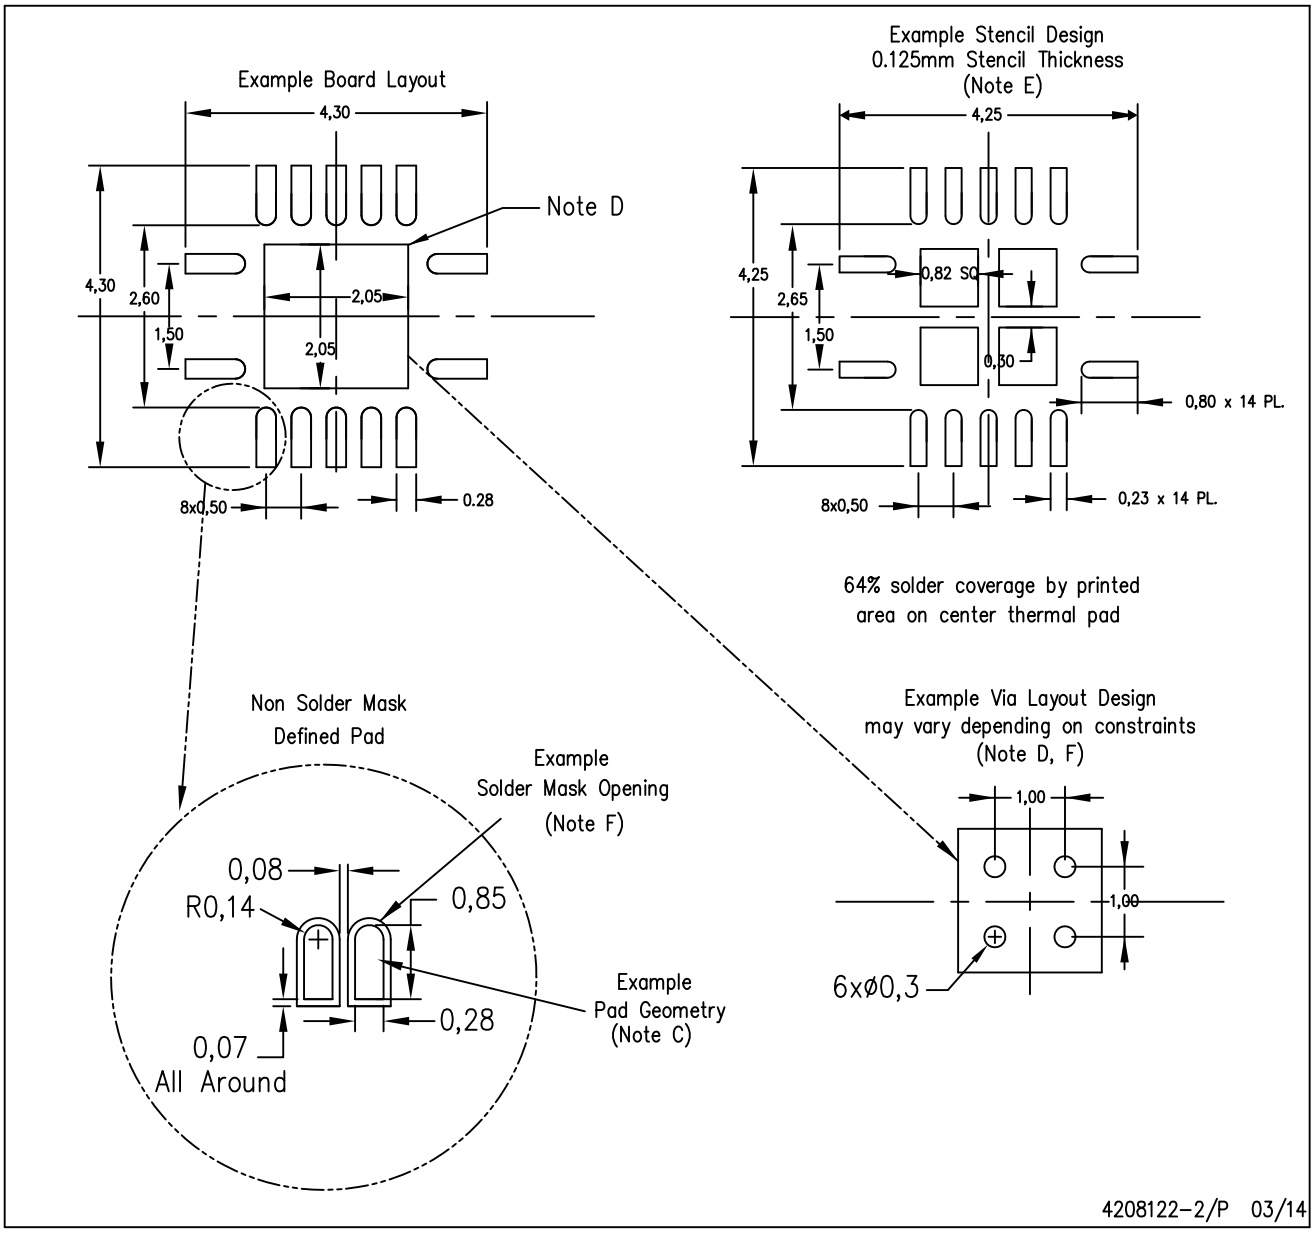
Bottom View

Exposed Thermal Pad Dimensions

4206353–2/P 03/14

NOTE: All linear dimensions are in millimeters

RGY (S–PVQFN–N14) PLASTIC QUAD FLATPACK NO–LEAD



NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC–7351 is recommended for alternate designs.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat–Pack QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <http: //www.ti.com>.
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
F. Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.

重要声明

德州仪器 (TI) 公司有权按照最新发布的 JESD46 对其半导体产品和服务进行纠正、增强、改进和其他修改，并不再按最新发布的 JESD48 提供任何产品和服务。买方在下订单前应获取最新的相关信息，并验证这些信息是否完整且是最新的。

TI 公布的半导体产品销售条款 (http://www.ti.com/sc/docs/stdterms.htm) 适用于 TI 已认证和批准上市的已封装集成电路产品的销售。另有其他条款可能适用于其他类型 TI 产品及服务的使用或销售。

复制 TI 数据表上 TI 信息的重要部分时，不得变更该等信息，且必须随附所有相关保证、条件、限制和通知，否则不得复制。TI 对该等复制文件不承担任何责任。第三方信息可能受到其它限制条件的制约。在转售 TI 产品或服务时，如果存在对产品或服务参数的虚假陈述，则会失去相关 TI 产品或服务的明示或暗示保证，且构成不公平的、欺诈性商业行为。TI 对此类虚假陈述不承担任何责任。

买方和在系统中整合 TI 产品的其他开发人员（总称“设计人员”）理解并同意，设计人员在设计应用时应自行实施独立的分析、评价和判断，且应全权 负责并确保 应用的安全性， 及设计人员的 应用 （包括应用中使用的所有 TI 产品）应符合所有适用的法律法规及其他相关要求。设计人员就自己设计的 应用声明，其具备制订和实施下列保障措施所需的一切必要专业知识，能够 (1) 预见故障的危险后果，(2) 监视故障及其后果，以及 (3) 降低可能导致危险的故障几率并采取适当措施。设计人员同意，在使用或分发包含 TI 产品的任何 应用前， 将彻底测试该等 应用和 该等应用中所用 TI 产品的 功能。

TI 提供技术、应用或其他设计建议、质量特点、可靠性数据或其他服务或信息，包括但不限于与评估模块有关的参考设计和材料（总称“TI 资源”），旨在帮助设计人员开发整合了 TI 产品的 应用， 如果设计人员（个人，或如果是代表公司，则为设计人员的公司）以任何方式下载、访问或使用任何特定的 TI 资源，即表示其同意仅为该等目标，按照本通知的条款使用任何特定 TI 资源。

TI 所提供的 TI 资源，并未扩大或以其他方式修改 TI 对 TI 产品的公开适用的质保及质保免责声明；也未导致 TI 承担任何额外的义务或责任。TI 有权对其 TI 资源进行纠正、增强、改进和其他修改。除特定 TI 资源的公开文档中明确列出的测试外，TI 未进行任何其他测试。

设计人员只有在开发包含该等 TI 资源所列 TI 产品的 应用时， 才被授权使用、复制和修改任何相关单项 TI 资源。但并未依据禁止反言原则或其他法理授予您任何TI知识产权的任何其他明示或默示的许可，也未授予您 TI 或第三方的任何技术或知识产权的许可，该等产权包括但不限于任何专利权、版权、屏蔽作品权或与使用TI产品或服务的任何整合、机器制作、流程相关的其他知识产权。涉及或参考了第三方产品或服务的信息不构成使用此类产品或服务的许可或与其相关的保证或认可。使用 TI 资源可能需要您向第三方获得对该等第三方专利或其他知识产权的许可。

TI 资源系“按原样”提供。TI 兹免除对资源及其使用作出所有其他明确或默认的保证或陈述，包括但不限于对准确性或完整性、产权保证、无屡发故障保证，以及适销性、适合特定用途和不侵犯任何第三方知识产权的任何默认保证。TI 不负责任何申索，包括但不限于因组合产品所致或与之有关的申索，也不为或对设计人员进行辩护或赔偿，即使该等产品组合已列于 TI 资源或其他地方。对因 TI 资源或其使用引起或与之有关的任何实际的、直接的、特殊的、附带的、间接的、惩罚性的、偶发的、从属或惩戒性损害赔偿，不管 TI 是否获悉可能会产生上述损害赔偿，TI 概不负责。

除 TI 已明确指出特定产品已达到特定行业标准（例如 ISO/TS 16949 和 ISO 26262）的要求外，TI 不对未达到任何该等行业标准要求而承担任何责任。

如果 TI 明确宣称产品有助于功能安全或符合行业功能安全标准，则该等产品旨在帮助客户设计和创作自己的 符合 相关功能安全标准和要求的应用。在应用内使用产品的行为本身不会 配有 任何安全特性。设计人员必须确保遵守适用于其应用的相关安全要求和 标准。设计人员不可将任何 TI 产品用于关乎性命的医疗设备，除非已由各方获得授权的管理人员签署专门的合同对此类应用专门作出规定。关乎性命的医疗设备是指出现故障会导致严重身体伤害或死亡的医疗设备（例如生命保障设备、心脏起搏器、心脏除颤器、人工心脏泵、神经刺激器以及植入设备）。此类设备包括但不限于，美国食品药品监督管理局认定为 III 类设备的设备，以及在美国以外的其他国家或地区认定为同等类别设备的所有医疗设备。

TI 可能明确指定某些产品具备某些特定资格（例如 Q100、军用级或增强型产品）。设计人员同意，其具备一切必要专业知识，可以为自己的应用选择适合的 产品， 并且正确选择产品的风险由设计人员承担。设计人员单方面负责遵守与该等选择有关的所有法律或监管要求。

设计人员同意向 TI 及其代表全额赔偿因其不遵守本通知条款和条件而引起的任何损害、费用、损失和/或责任。
