LP5922 具有低输入和输出电压能力的 2A 低噪声可调 LDO

1 特性

- 宽输入电压范围：1.3V 至 6V
- 支持低 V_{IN} 电压，无需额外的偏置电源
- 可调节输出电压：0.5V 至 5V
- 低压降：200mA（2A 负载时）
- 低输出电压噪声：25µV_{RMS}
- 输出电流：2A
- 运行结温范围：-40°C 至 +125°C
- 可编程软启动，可限制浪涌电流
- 3mm × 3mm × 0.75mm 10 引脚晶圆级小外形无引线 (WSON) 封装
- 热过载保护和短路保护
- 输出电压容差：±1.5%
- 关断电源电流：0.1µA
- 电源抑制比 (PSRR)：70dB（1kHz 频率时）
- 电源正常输出

2 应用

- 空间受限型 应用
- 噪声敏感型和纹波敏感型高电流模拟或射频系统
- 目标领域
  – 医疗、测试和测量设备
  – 便携式消费类电子产品
  – 电信和网卡
  – 无线基础设施
  – 工业 应用
- 典型系统
  – 无线电收发器、功率放大器、锁相环 (PLL)/合成器、定时、压控振荡器 (VCO)、通用分组无线业务 (GPRS)、3G 模块、现场可编程门阵列 (FPGA)、数字信号处理器 (DSP)、图形处理单元 (GPU) 等等

3 说明

LP5922 是一款 2A 低压降 (LDO) 线性稳压器，在最大电流情况下的典型压降为 200mV。LP5922 器件支持的工作电源轨低至 1.3V，无需额外的偏置电源。凭借低压降和低 V_{IN} 能力，有效确保了最大的系统效率和最小功耗。该器件还 具有 低静态电流和超低关断电流。

LP5922 器件的设计旨在追求高 PSRR 和低输出噪声，以期在没有额外滤波功能的 情况下 为敏感型模拟应用提供支持。甚至只需在 SS/NR 引脚连接一个小电容即可使输出噪声进一步得到降低。

输出电压可通过外部电阻分压器调节，范围为 0.5V 到 5V。使能引脚、可调软启动和可选电源正常 特性 有助于实施系统电源排序。浪涌电流可通过软启动加以控制，而且器件还具有短路保护和热保护。

Pin Functions

PIN		I/O	DESCRIPTION
NUMBER	NAME		
1	OUT	O	Regulated output voltage, connect directly to pin 2
2	OUT	O	Regulated output voltage, connect directly to pin 1
3	FB	I	Voltage feedback input to the internal error amplifier
4	GND	Ground	Ground; connect to device pin 8.
5	PG	O	Power Good to indicate the status of output voltage. Requires an external pull-up resistor. When PG pin voltage is high the output voltage is considered good.
6	EN	I	Enable
7	SS/NR	I/O	Soft-start and noise reduction pin
8	GND	Ground	Ground —connect to device pin 4.
9	IN	I	Supply voltage input — connect directly to pin 10.
10	IN	I	Supply voltage input —connect directly to pin 9.
Exposed pad	Thermal Pad	—	The exposed thermal pad on the bottom of the package must be connected to a copper area under the package on the PCB. Connect to ground potential. Do not connect to any potential other than the same ground potential seen at device pins 4 and 8 (GND). See *Power Dissipation* for more information.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)(2)

	MIN	MAX	UNIT
IN pin voltage, V_{IN}	–0.3	7	V
OUT pin voltage, V_{OUT}	See(3)		
EN pin voltage, V_{EN}	–0.3	7	V
PG pin voltage, V_{PG}	–0.3	7	V
SS/NR pin voltage, $V_{SS/NR}$	–0.3	3.6	V
FB pin voltage, V_{FB}	–0.3	3.6	V
Junction temperature, T_J		150	°C
Continuous power dissipation(4)	Internally limited		
Storage temperature, T_{stg}	–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltages are with respect to the potential at the GND pin.
(3) Absolute maximum V_{OUT} is the lesser of V_{IN} + 0.3 V, or 7 V.
(4) Internal thermal shutdown circuitry protects the device from permanent damage.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101(2)	±1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
Input voltage, V_{IN}	1.3		6	V
Output voltage, V_{OUT}	0.5		5	V
FB voltage, V_{FB}		0.5		V
EN input voltage, V_{EN}	0		V_{IN}	V
Recommended load current, I_L	0		2	A
Operating junction temperature, $T_{J-MAX-OP}$	–40		125	°C

6.4 Thermal Information

THERMAL METRIC(1)		LP5922 DSC (WSON) 10 PINS	UNIT
$R_{\theta JA}$(2)	Junction-to-ambient thermal resistance, High K	49.5(3)	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	38.2	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	24.0	°C/W
ψ_{JT}	Junction-to-top characterization parameter	0.5	°C/W
ψ_{JB}	Junction-to-board characterization parameter	24.1	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	6.0	°C/W

(1) For more information about traditional and new thermal metrics, see *Semiconductor and IC Package Thermal Metrics*.
(2) Thermal resistance value $R_{\theta JA}$ is based on the EIA/JEDEC High-K printed circuit board defined by *JESD51-7 - High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages.*
(3) The PCB for the WSON/DSC package $R_{\theta JA}$ includes four (4) thermal vias, in a 2 × 2 array, under the exposed thermal pad per EIA/JEDEC JESD51-5.

6.5 Electrical Characteristics

V_{IN} = $V_{OUT(NOM)}$ + 0.5 V or 1.3 V, whichever is greater; V_{EN} = 1.2 V, C_{IN} = 22 µF, C_{OUT} = 22 µF, OUT connected to 50 Ω to GND, V_{FB} = 0.5 V, $C_{SS/NR}$ = 0.12 µF, C_{FF} = 0.01 µF, and PG pin pulled up to V_{IN} by 100-kΩ resistor (unless otherwise noted).(1)(2)(3)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SUPPLY VOLTAGE						
V_{IN}	Input voltage range		1.3		6	V
UVLO	Undervoltage lock-out threshold	V_{IN} Rising (↑) until output is ON		1.2	1.25	V
ΔUVLO	UVLO hysteresis	V_{IN} Falling (↓) from UVLO threshold until output is OFF		160		mV
OUTPUT VOLTAGE AND REGULATION						
V_{OUT}	Output voltage range		0.5		5	V
ΔV_{OUT}	Line regulation	I_{OUT} = 5 mA, 1.3 V ≤ V_{IN} ≤ 6 V		0.02		%/V
	Load regulation	5 mA ≤ I_{OUT} ≤ 2 A		0.1		%/A
V_{DO}	Dropout voltage(4)	V_{IN} = 1.4 V, I_{OUT} = 2 A		220	400	mV
		V_{IN} = 2.5 V, I_{OUT} = 2 A		100	180	
		V_{IN} = 5.3 V, I_{OUT} = 2 A		90	160	
FB						
V_{FB}	FB voltage	I_{OUT} = 5 mA to 2 A	492.5	500	507.5	mV
I_{FB}	FB pin input current	V_{FB} = 0.5 V	–100		100	nA
CURRENT LEVELS						
I_L	Maximum load current	V_{IN} ≥ 1.3 V	2			A
I_{SC}	Short-circuit current limit(5)		2.2	3	3.8	A
I_{GND}	Ground-current minimum load(6)	V_{IN} = 6 V, I_{OUT} = 0 mA		0.7		mA
	Ground-current maximum load(6)	V_{IN} = 1.3 V, I_{OUT} = 2 A		1	4	
$I_{GND(SD)}$	Shutdown current(7)	V_{IN} = 6 V, V_{EN} = 0 V, V_{PG} = 0 V		0.1	15	µA
V_{IN} to V_{OUT} RIPPLE REJECTION (8)						
PSRR	Power-supply rejection ratio	V_{IN} ≥ 1.4 V, f = 1 kHz, I_{OUT} = 2 A		70		dB
		V_{IN} ≥ 1.4 V, f = 10 kHz, I_{OUT} = 2 A		55		
		V_{IN} ≥ 1.4 V, f = 100 kHz, I_{OUT} = 2 A		40		
		V_{IN} ≥ 1.4 V, f = 1 MHz, I_{OUT} = 2 A		30		
OUTPUT NOISE VOLTAGE						
e_N	Noise voltage(8)	V_{IN}= 2.5 V, V_{OUT}= 1.8 V BW = 10 Hz to 100 kHz		25		$µV_{RMS}$

(1) All voltages are with respect to the GND pin.
(2) Minimum and maximum limits are design targeted limits over the junction temperature (T_J) range of –40°C to +125°C, unless otherwise stated. Typical values represent the most likely parametric norm at T_J = 25°C, and are provided for reference purposes only.
(3) C_{IN}, C_{OUT}: Low-ESR surface-mount-ceramic capacitors (MLCCs) used in setting electrical characteristics.
(4) Dropout voltage is the voltage difference between the input and the output at which the FB voltage drops to 97% of its nominal value.
(5) Short-circuit current (I_{SC}) is equivalent to current limit. To minimize thermal effects during testing, I_{SC} is measured with V_{OUT} pulled to 100 mV below its nominal voltage.
(6) Ground current is defined here as the total current flowing to ground as a result of all voltages applied to the device $I_{GND} = ((I_{IN} – I_{OUT}) + I_{EN} + I_{LKG(PG)})$
(7) Ground current in shutdown mode, $I_{GND(SD)}$, does NOT include current from PG pin.
(8) This specification is verified by design.

Electrical Characteristics (continued)

$V_{IN} = V_{OUT(NOM)}$ + 0.5 V or 1.3 V, whichever is greater; V_{EN} = 1.2 V, C_{IN} = 22 µF, C_{OUT} = 22 µF, OUT connected to 50 Ω to GND, V_{FB} = 0.5 V, $C_{SS/NR}$ = 0.12 µF, C_{FF} = 0.01 µF, and PG pin pulled up to V_{IN} by 100-kΩ resistor (unless otherwise noted).(1)(2)(3)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
LOGIC INPUT THRESHOLDS						
$V_{IL(EN)}$	EN pin low threshold	V_{EN} falling (↓) until output is OFF			0.35	V
$V_{IH(EN)}$	EN pin high threshold	V_{EN} rising (↑) until output is ON	1.2			V
I_{EN}	Input current at EN pin (9)	V_{IN} = 6 V, V_{EN} = 6 V		3		µA
PG_{HTH}	PG high threshold (% of nominal V_{OUT})	V_{OUT} rising (↑) until PG goes high		94%		
PG_{LTH}	PG low threshold (% of nominal V_{OUT})	V_{OUT} falling (↓) until PG goes low		90%		
$V_{OL(PG)}$	PG pin low-level output voltage	$V_{OUT} < PG_{LTH}$, sink current = 1 mA			400	mV
$I_{LKG(PG)}$	PG pin leakage current	$V_{OUT} > PG_{HTH}$, V_{PG} = 6 V			1	µA
SOFT START						
I_{SS}	SS/NR pin charging current			6.2		µA
THERMAL SHUTDOWN						
T_{SD}	Thermal shutdown temperature			165		°C
ΔT_{SD}	Thermal shutdown hysteresis			15		°C
TRANSITION CHARACTERISTICS						
ΔV_{OUT}	Line transients	ΔV_{IN} = 0.5 V, V_{OUT} = 2.8 V, $t_{RISE} = t_{FALL}$ = 5 µs		3		mV
	Load transients	V_{OUT} = 3.3 V, I_{OUT} = 10 mA to 2 A to 10 mA $t_{RISE} = t_{FALL}$ = 1 V/µs		25		
R_{AD}	Output discharge pull-down resistance	V_{EN} = 0 V, V_{IN} = 2.3 V		400		Ω

(9) There is a 2-MΩ resistor between EN and ground (pulldown) on the device.

6.6 Input and Output Capacitors

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
C_{IN}	Input capacitance(1)			22		µF
C_{OUT}	Output capacitance	V_{OUT} ≤ 0.8 V	34	47		µF
		V_{OUT} > 0.8 V	15	22		

(1) Typically input capacitance placed close to the device is in the same order as output capacitance. See also *Input Capacitor, C_{IN}*.

6.7 Typical Characteristics

V_{IN} = V_{OUT} + 0.5 V, V_{EN} = 1.2 V, C_{IN} = 22 µF, C_{OUT} = 22 µF, OUT connected to 50 Ω to GND, V_{FB} = 0.5 V, $C_{SS/NR}$ = 0.12 µF, C_{FF} = 0.01 µF, and PG pin pulled up to V_{IN} by 100-kΩ resistor and T_J = 25°C, unless otherwise stated.

7 Detailed Description

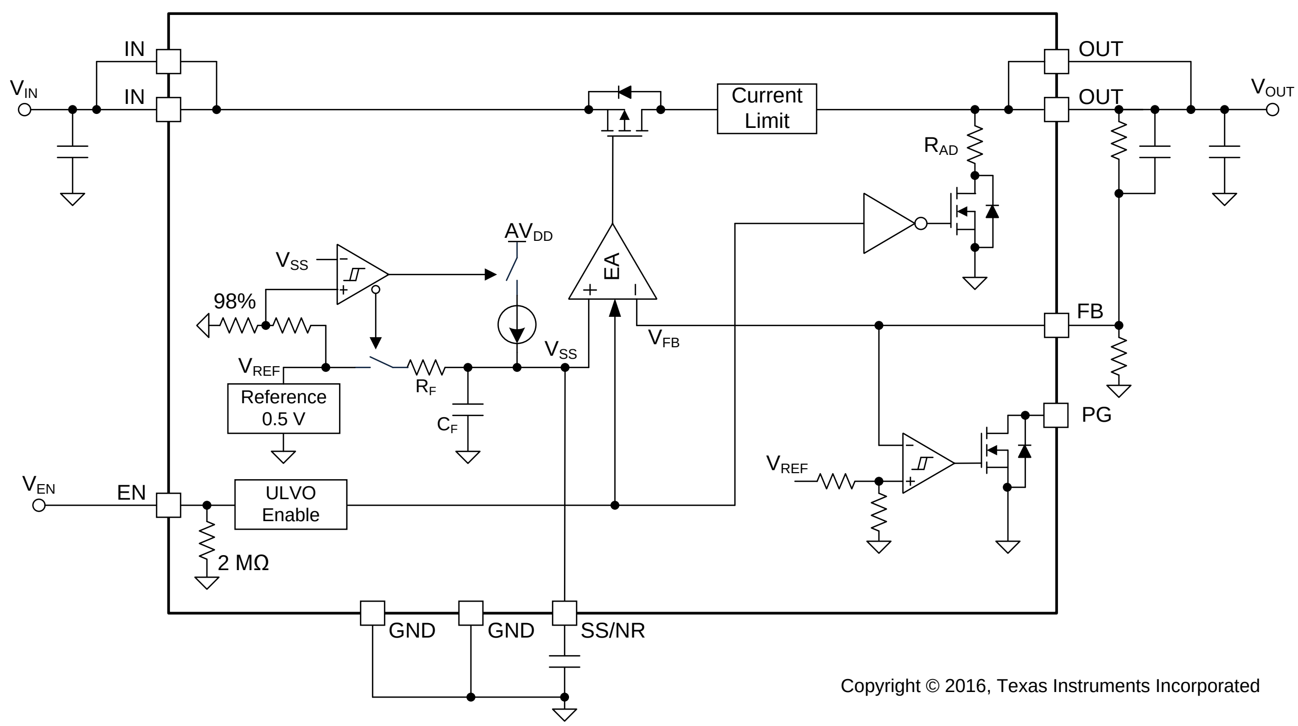
7.1 Overview

The LP5922 is a low-noise, high PSRR, low-dropout regulator capable of sourcing a 2-A load. The LP5922 can operate down to 1.3-V input voltage and 0.5-V output voltage. This combination of low noise, high PSRR, and low output voltage makes the device an ideal low dropout (LDO) regulator to power a multitude of loads from noise-sensitive communication components to battery-powered system.

The LP5922 block diagram contains several features, including:

- Low-noise, 0.5-V reference
- Internal protection circuit, such as current limit and thermal shutdown
- Programmable soft-start circuit
- Power Good output

7.2 Functional Block Diagram



7.3 Feature Description

7.3.1 Output Voltage

The LP5922 output voltage can be set to any value from 0.5 V to 5 V using two external resistors shown as R_{UPPER} and R_{LOWER} in Figure 15. The value for the R_{LOWER} should be less than or equal to 100 kΩ for good loop compensation. R_{UPPER} can be selected for a given V_{OUT} using Equation 1:

$$R_{UPPER} = \frac{(V_{OUT} - V_{FB}) \times R_{LOWER}}{V_{FB}}$$

where

- $V_{FB} = 0.5$ V (1)

Feature Description (continued)

7.3.2 Enable

The LP5922 EN pin is internally held low by a 2-MΩ resistor to GND. The EN pin voltage must be higher than the V_{IH} threshold to ensure that the device is fully enabled under all operating conditions. The EN pin voltage must be lower than the VIL threshold to ensure that the device is fully disabled and the automatic output discharge is activated.

7.3.3 Output Automatic Discharge

The LP5922 output employs an internal 400-Ω (typical) pulldown resistance to discharge the output capacitor when the EN pin is low, and the device is disabled.

7.3.4 Programmable Soft Start and Noise Reduction

The output voltage of LP5922 ramps up linearly in a constant slew rate until reaching the target regulating voltage after a stable V_{IN} (greater than V_{OUT} + V_{DO}) is supplied and EN pin is pulled high. The slew rate of V_{OUT} ramping is programmable by an external capacitor on the SS/NR pin; therefore, the duration for soft-start period is programmable as well. Once the LP5922 is enabled, the SS/NR pin sources a constant 6-µA current to charge the external $C_{SS/NR}$ capacitor until the voltage at the SS/NR pin reaches 98% of the internal reference voltage (V_{REF}) of 500 mV typical. The final 2% of $C_{SS/NR}$ charge is determined by a RC time constant. During the soft-start period, the current flowing into the IN pin primarily consists of the sum of the load current at the LDO output and the charging current into the output capacitor. The soft-start period can be calculated by Equation 2:

$$t_{SS} = \frac{C_{SS/NR} \times V_{FB}}{I_{SS}}$$

where

- V_{FB} = 0.5 V - this is the voltage that $C_{SS/NR}$ charges to;
- $C_{SS/NR}$ is the value of the capacitor connected between the SS/NR pin and ground; and
- I_{SS} = 6.2 µA is the typical charging current to the SS/NR pin during start-up period. (2)

The recommended value for $C_{SS/NR}$ is 100 nF or larger. Equation 2 is most accurate for these values. The $C_{SS/NR}$ capacitor is also the filter capacitor for internal reference for noise reduction purpose. An integrated resistor and the $C_{SS/NR}$ capacitor structure a RC low-pass filter to remove the noise on the internal reference voltage.

7.3.5 Internal Current Limit

The internal current limit circuit is used to protect the LDO against high-load current faults or shorting events. The LDO is not designed to operate in a steady-state current limit. During a current-limit event, the LDO sources constant current. Therefore, the output voltage falls when load impedance decreases. Note also that if a current limit occurs and the resulting output voltage is low, excessive power may be dissipated across the LDO, resulting in a thermal shutdown of the output.

7.3.6 Thermal Overload Protection

Thermal shutdown disables the output when the junction temperature rises to T_{SD} level, which allows the device to cool. When the junction temperature cools by ΔT_{SD}, the output circuitry enables. Based on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This thermal cycling limits the dissipation of the regulator and protects it from damage as a result of overheating.

The internal protection circuitry of the LP5922 is designed to protect against thermal overload conditions. The circuitry is not intended to replace proper heat sinking. Continuously running the LP5922 into thermal shutdown degrades device reliability.

Feature Description (continued)

7.3.7 Power Good Output

The LP5922 has a Power-Good function that works by toggling the state of the PG output pin. When the output voltage falls below the PG threshold voltage (PG_{LTH}), the PG pin open-drain output engages (low impedance to GND). When the output voltage rises above the PG threshold voltage (PG_{HTH}), the PG pin becomes high-impedance. By connecting a pullup resistor to an external supply, any downstream device can receive PG as a logic signal. User must make sure that the external pullup supply voltage results in a valid logic signal for the receiving device or devices; use a pullup resistor from 10 kΩ to 100 kΩ for best results.

In Power-Good function, the PG output pin pulled high immediatelly after output voltage rises above the PG threshold voltage.

7.4 Device Functional Modes

7.4.1 Enable (EN)

The LP5922 enable (EN) pin is internally held low by a 2-MΩ resistor to GND. If the EN pin is open the output is OFF. The EN pin voltage must be higher than the V_{IH} threshold to ensure that the device is fully enabled under all operating conditions. When the EN pin is pulled low, and the output is disabled, the output automatic discharge circuit is activated. Any charge on the OUT pin is discharged to GND through the internal pulldown resistance.

7.4.2 Undervoltage Lockout (UVLO)

The LP5922 incorporates UVLO. The UVLO circuit monitors the input voltage and keeps the LP5922 disabled while a rising V_{IN} is less than 1.2 V (typical). The rising UVLO threshold is approximately 100 mV below the recommended minimum operating V_{IN} of 1.3 V.

7.4.3 Minimum Operating Input Voltage

The LP5922 internal circuit is not fully functional until V_{IN} is at least 1.3 V. The output voltage is not regulated until V_{IN} has reached at least the greater of 1.3 V or (V_{OUT} + V_{DO}).

8 Applications and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The LP5922 is designed to meet the requirements of RF and analog circuits, by providing low noise, high PSRR, low quiescent current, and low line or load transient response figures. The device offers excellent noise performance without the need for a noise bypass capacitor and is stable with input and output capacitors with a value of 22 µF. The LP5922 delivers this performance in an industry-standard WSON package which, for this device, is specified with an operating junction temperature (T_J) of –40°C to +125°C.

8.2 Typical Application

Figure 15 shows the typical application circuit for the LP5922. Input and output capacitances may need to be increased above 22 µF minimum for some applications.

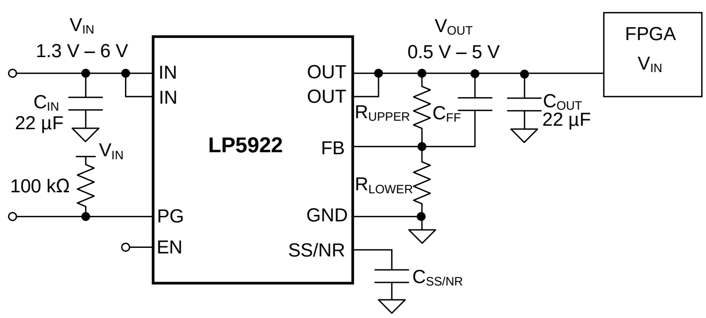


Figure 15. LP5922 Typical Application

8.2.1 Design Requirements

For typical LP5922 applications, use the parameters listed in Table 1.

Table 1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage	2.25 V to 2.75 V
Output voltage	1.8 V
Output current	2000 mA
Output capacitor range	22 µF to 47 µF
Output capacitor ESR range	2 mΩ to 500 mΩ

8.2.2 Detailed Design Procedure

8.2.2.1 External Capacitors

The LP5922 is designed to be stable using low equivalent series resistance (ESR) ceramic capacitors at the input, output, and the noise-reduction pin (SS/NR). Multilayer ceramic capacitors have become the industry standard for these types of applications and are recommended, but must be used with good judgment. Ceramic capacitors that employ X7R-, X5R-, and COG-rated dielectric materials provide relatively good capacitive stability across temperature, whereas the use of Y5V-rated capacitors is discouraged because of large variations in capacitance. Additionally, the case size has a direct impact on the capacitance versus applied voltage derating.

Regardless of the ceramic capacitor type selected, the actual capacitance varies with the applied operating voltage and temperature. As a rule of thumb, derate ceramic capacitors by at least 50%. The input and output capacitors recommended herein account for a effective capacitance derating of approximately 50%, but at high applied voltage conditions the capacitance derating can be greater than 50% and must be taken into consideration. The minimum capacitance values declared in *Input and Output Capacitors* must be met across the entire expected operating voltage range and temperature range.

8.2.2.2 Input Capacitor, C_{IN}

An input capacitor is required for stability. A capacitor with a value of at least 22 µF must be connected between the LP5922 IN pin and ground for stable operation over full load current range. It is acceptable to have more output capacitance than input, as long as the input is at least 22 µF.

The input capacitor must be located as close as possible to, but at a distance not more than 1 cm from, the IN pin and returned to the device GND pin with a clean analog ground. This will minimize the trace inductance between the capacitor and the device. Any good quality ceramic or tantalum capacitor may be used at the input.

8.2.2.3 Output Capacitor, C_{OUT}

The LP5922 is designed to work specifically with a low ESR ceramic (MLCC) output capacitor, typically 22 µF. A ceramic capacitor (dielectric types X5R or X7R) in the 22-µF to 100-µF range, with an ESR not exceeding 500 mΩ, is suitable in the LP5922 application circuit having an output voltage greater than 0.8 V. For output voltages of 0.8 V or less, the output capacitance must be increased to typically 47 µF. The output capacitor must be connected between the device OUT and GND pins. The output capacitor must meet the requirement for the minimum value of capacitance and have an ESR value that does not exceed 500 mΩ to ensure stability.

It is possible to use tantalum capacitors at the device output, but these are not as attractive for reasons of size, cost, and performance.

A combination of multiple output capacitors in parallel boosts the high-frequency PSRR. The combination of one 0805-sized, 47-µF ceramic capacitor in parallel with two 0805-sized, 10-µF ceramic capacitors with a sufficient voltage rating optimizes PSRR response in the frequency range of 400 kHz to 700 kHz (which is a typical range for dc-dc supply switching frequency). This 47-µF || 10-µF || 10-µF combination also ensures that at high input voltage and high output voltage configurations, the minimum effective capacitance is met. Many 0805-sized, 47-µF ceramic capacitors have a voltage derating of approximately 60% to 75% at 5 V, so the addition of the two 10-µF capacitors ensures that the capacitance is at or above 22 µF.

8.2.2.4 Soft-Start and Noise-Reduction Capacitor, $C_{SS/NR}$

Recommended value for $C_{SS/NR}$ is 100 nF or larger. The soft-start period can be calculated by Equation 2. The $C_{SS/NR}$ capacitor is also the filter capacitor for internal reference for noise reduction purpose.

8.2.2.5 Feed-Forward Capacitor, C_{FF}

Although a feed-forward capacitor (C_{FF}) from the FB pin to the OUT pin is not required to achieve stability, a 10-nF external C_{FF} optimizes the transient, noise, and PSRR performance. A higher capacitance C_{FF} value can be used; however, the start-up time may be longer and the Power-Good signal may incorrectly indicate that the output voltage is settled. The maximum recommended value is 100 nF

To ensure proper PGx functionality, the time constant defined by CNR/SSx must be greater than or equal to the time constant from CFFx. For a detailed description, see the application report *Pros and Cons of Using a Feed-Forward Capacitor with a Low Dropout Regulator* (SBVA042).

8.2.2.6 No-Load Stability

The LP5922 remains stable, and in regulation, with no external load.

8.2.2.7 Power Dissipation

Knowing the device power dissipation and proper sizing of the thermal plane connected to the exposed thermal pad is critical to ensuring reliable operation. Device power dissipation depends on input voltage, output voltage, and load conditions and can be calculated with Equation 3.

$$P_{D(MAX)} = (V_{IN(MAX)} – V_{OUT}) \times I_{OUT} \quad (3)$$

Power dissipation can be minimized, and greater efficiency can be achieved, by using the lowest available voltage drop option that is greater than the dropout voltage (V_{DO}). However, keep in mind that higher voltage drops result in better dynamic (that is, PSRR and transient) performance.

On the WSON (DSC) package, the primary conduction path for heat is through the exposed thermal pad into the PCB. To ensure the device does not overheat, connect the exposed thermal pad, through multiple thermal vias, to an internal ground plane with an appropriate amount of PCB copper area.

Power dissipation and junction temperature are most often related by the junction-to-ambient thermal resistance ($R_{\theta JA}$) of the combined PCB and device package and the temperature of the ambient air (T_A), according to Equation 4 or Equation 5:

$$T_{J(MAX)} = T_{A(MAX)} + (R_{\theta JA} \times P_{D(MAX)}) \quad (4)$$

$$P_D = (T_{J(MAX)} – T_{A(MAX)}) / R_{\theta JA} \quad (5)$$

If the V_{IN}-V_{OUT} voltage is known, the maximum allowable output current can be calculated with Equation 6

$$I_{OUT(MAX)} = (((125°C - T_A) / R_{\theta JA}) / (V_{IN} – V_{OUT})) \quad (6)$$

Unfortunately, the $R_{\theta JA}$ value is highly dependent on the heat-spreading capability of the particular PCB design, and therefore varies according to the PCB size, total copper area, copper weight, any thermal vias, and location of the planes. The $R_{\theta JA}$ recorded in *Thermal Information* is determined by the specific EIA/JEDEC JESD51-7 standard for PCB and copper spreading area, and is to be used only as a relative measure of package thermal performance. For a well designed thermal layout, $R_{\theta JA}$ is actually the sum of the package junction-to-case (bottom) thermal resistance ($R_{\theta JC(bot)}$) plus the thermal resistance contribution by the PCB copper area acting as a heat sink.

8.2.2.8 Estimating Junction Temperature

The JEDEC standard now recommends the use of psi (Ψ) thermal metrics to estimate the junction temperatures of the LDO when in-circuit on a typical PCB board application. These metrics are not strictly speaking thermal resistances, but rather offer practical and relative means of estimating junction temperatures. These psi metrics are determined to be significantly independent of the copper-spreading area. The key thermal metrics (Ψ_{JT} and Ψ_{JB}) are given in the *Thermal Information* table and are used in accordance with Equation 7 and Equation 8.

$$T_{J(MAX)} = T_{TOP} + (\Psi_{JT} \times P_{D(MAX)})$$

where

- T_{TOP} is the temperature measured at the center-top of the device package.
- $P_{D(MAX)}$ is described at Equation 3 (7)

$$T_{J(MAX)} = T_{BOARD} + (\Psi_{JB} \times P_{D(MAX)})$$

where

- T_{BOARD} is the PCB surface temperature measured 1 mm from the device package and centered on the package edge.
- $P_{D(MAX)}$ is described at Equation 3 (8)

For more information about the thermal characteristics Ψ_{JT} and Ψ_{JB}, see *Semiconductor and IC Package Thermal Metrics* ; for more information about measuring T_{TOP} and T_{BOARD}, see *Using New Thermal Metrics* ; and for more information about the EIA/JEDEC JESD51 PCB used for validating $R_{\theta JA}$, see the *TI Application Report Thermal Characteristics of Linear and Logic Packages Using JEDEC PCB Designs*. These application notes are available at www.ti.com.

8.2.2.9 Recommended Continuous Operating Area

The continuous operational area of an LDO is limited by the input voltage (V_{IN}), the output voltage (V_{OUT}), the dropout voltage (V_{DO}), the output current (I_{OUT}), and the junction temperature (T_J). The recommended area for continuous operation for a linear regulator can be separated into the following steps, and is shown in Figure 16.

- Limited by dropout: Dropout voltage limits the minimum differential voltage between the input and the output (V_{IN} – V_{OUT}) at a given output current level.
- Limited by the rated output current: The rated output current limits the maximum recommended output current level. Exceeding this rating causes the device to fall out of specification.
- Limited by thermals: This portion of the boundary is defined by Equation 6. The slope is nonlinear because the junction temperature of the LDO is controlled by the power dissipation (P_D) across the LDO; therefore, when V_{IN} – V_{OUT} increases, the output current must decrease in order to ensure that the rated maximum operating junction temperature of the device is not exceeded. Exceeding the maximum operating junction temperature rating can cause the device to fall out of specifications, reduces long-term reliability, and may activate the thermal shutdown protection circuitry.
- Limited by V_{IN} range: The rated operating input voltage range governs both the minimum and maximum of V_{IN} – V_{OUT}.

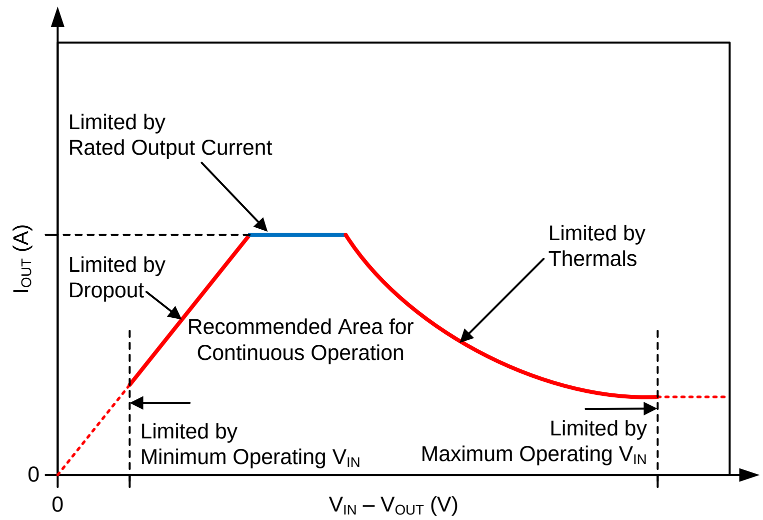

Figure 16. Recommended Continuous Operating Area

Figure 17 to Figure 22 show the recommended continuous operating area boundaries for this device in the WSON (DSC) package mounted to a EIA/JEDEC High-K printed circuit board, as defined by JESD51-7, with an $R_{\theta JA}$ rating of 49.5°C/W.

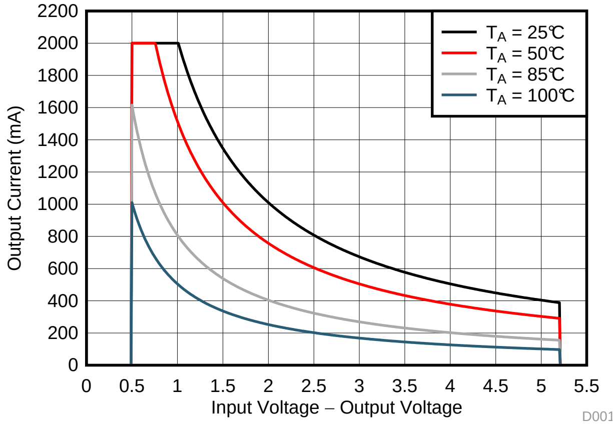

Figure 17. Recommended Continuous Operating Area for V_{OUT} = 0.8 V

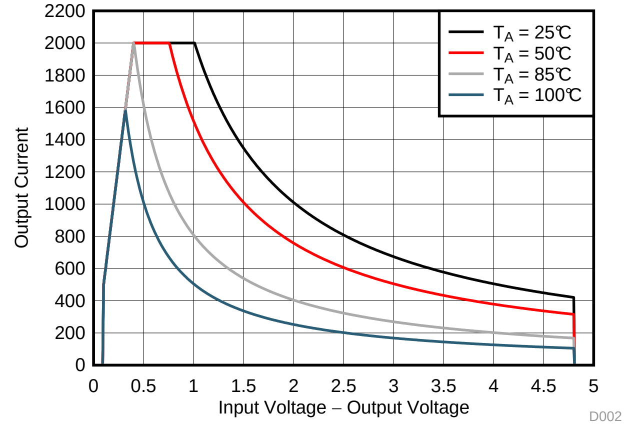

Figure 18. Recommended Continuous Operating Area for V_{OUT} = 1.2 V

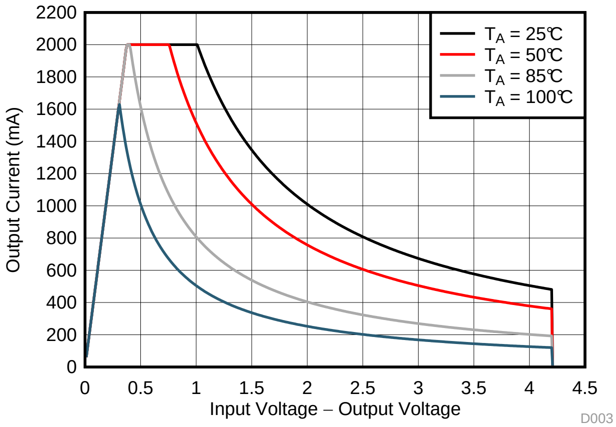

Figure 19. Recommended Continuous Operating Area for V_{OUT} = 1.8 V

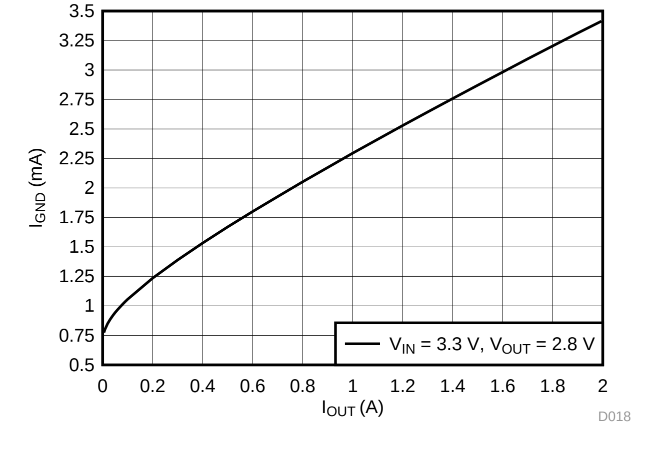

Figure 24. Ground Current vs Output Current

9 Power Supply Recommendations

This device is designed to operate from an input supply voltage range of 1.3 V to 6 V. The input supply should be well regulated and free of spurious noise. To ensure that the LP5922 output voltage is well regulated and dynamic performance is optimum, the input supply must be at least V_{OUT} + 1 V. A minimum capacitor value of 22 µF is required to be within 1 cm of the IN pin.

10 Layout

10.1 Layout Guidelines

The dynamic performance of the LP5922 is dependant on the layout of the PCB. PCB layout practices that are adequate for typical LDOs may degrade the PSRR, noise, or transient performance of the LP5922.

Best performance is achieved by placing C_{IN} and C_{OUT} on the same side of the PCB as the LP5922 device, and as close as is practical to the package. The ground connections for C_{IN} and C_{OUT} must be back to the LP5922 GND pin using as wide and as short of a copper trace as is practical.

Avoid connections using long trace lengths, narrow trace widths, or connections through vias. These add parasitic inductances and resistance that results in inferior performance especially during transient conditions

10.2 Layout Example

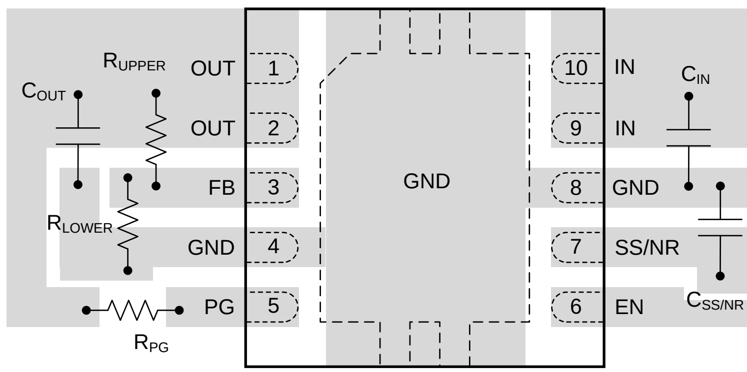

Figure 25. LP5922 Typical Layout

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LP592201DSCR	ACTIVE	WSON	DSC	10	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 125	592201	Samples
LP592201DSCT	ACTIVE	WSON	DSC	10	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 125	592201	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
