

DACx551-Q1 Automotive 16-, 12-Bit, Ultralow-Glitch, Voltage-Output DAC

1 Features

- Qualified for Automotive Applications
- AEC-Q100 Qualified With the Following Results:
 - Device Temperature Grade 1: -40°C to 125°C Ambient Operating Temperature Range
 - Device HBM ESD Classification Level 2
 - Device CDM ESD Classification Level C4B
- Relative Accuracy:
 - DAC8551-Q1 (16-Bit): 4 LSB INL
 - DAC6551-Q1 (12-Bit): 0.3 LSB INL
- Ultralow Glitch Impulse: 0.1 nV-s
- Settling Time: 8 μs to $\pm 0.003\%$ FSR
- Power Supply: 3 V to 5.5 V
- Power-On Reset to Zero Scale
- *MicroPower* Operation: 160 μA at 5 V
- Low-Power Serial Interface With Schmitt-Triggered Inputs
- On-Chip Output Buffer Amplifier With Rail-to-Rail Operation
- Power-Down Capability
- Binary Input
- SYNC Interrupt Facility
- Available in a Tiny VSSOP-8 Package

2 Applications

- Automotive Radar
- Automotive Sensors

3 Description

The DAC8551-Q1 and DAC6551-Q1 are small, low-power, voltage-output, 16- and 12-bit digital-to-analog converters (DACs) qualified for automotive applications. The DACx551-Q1 devices provide good linearity and minimize undesired code-to-code transient voltages. The devices use a versatile 3-wire serial interface that operates at clock rates to 30 MHz and is compatible with standard SPI, QSPI, Microwire, and digital signal-processor (DSP) interfaces.

The DACx551-Q1 devices require an external reference voltage to set the output range. The devices incorporate a power-on-reset circuit that ensures the DAC output powers up at 0 V and remains there until a valid write to the device takes place. The devices contain a power-down feature, accessed over the serial interface, that reduces the current consumption to 800 nA at 5 V.

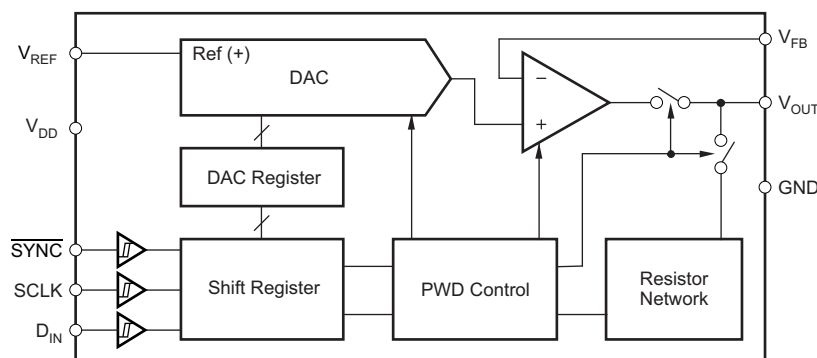

The DACx551-Q1 devices power consumption is only 800 μW at 5 V, reducing to less than 4 μW in power-down mode. The DACx551-Q1 devices are available in a VSSOP-8 package.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DAC8551-Q1	VSSOP (8)	3.00 mm x 3.00 mm
DAC6551-Q1		

(1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

Changes from Revision B (November 2016) to Revision C

Page

• Added device DAC6551-Q1 to the data sheet	1
• Changed the data sheet Title From: DAC8551-Q1 Automotive 16-Bit... To: DACx551-Q1 Automotive 16-, 12-Bit...	1
• Changed Relative Accuracy in the <i>Features</i> section	1
• Updated the <i>Description</i> to include the DAC6551-Q1 device	1
• Added DAC6551-Q1 to the <i>Thermal Table</i>	5
• Added separate lines for the DAC6551-Q1 and DAC8551-Q1 devices for Resolution, Relative accuracy, and Differential nonlinearity in the <i>Electrical Characteristics</i> table	5
• Changed Note 1 of the <i>Electrical Characteristics</i> table	6
• Updated the <i>Overview</i> section to include the DAC6551-Q1 device	13
• Changed Equation 1	13
• Changed the definitions of in the "where:" statement for Equation 1	14
• Deleted a sentence from the <i>Resistor String</i> section: "Monotonicity is ensured because of the string resistor architecture."	14
• Added Figure 31	16
• Updated the <i>Application Information</i> section to include the DAC6551-Q1 device	17
• Updated the <i>Using the REF02 As a Power Supply for the DACx551-Q1 Device</i> section to include the DAC6551-Q1 device	19
• Updated the <i>System Examples</i> section to include the DAC6551-Q1 device	20
• Updated the <i>Power Supply Recommendations</i> section to include the DAC6551-Q1 device	21
• Updated the <i>Layout Guidelines</i> section to include the DAC6551-Q1 device	21

Changes from Revision A (March 2016) to Revision B	Page
• Changed Relative Accuracy in the <i>Features</i> section	1
• Changed power supply voltage in the <i>Features</i> section	1
• Changed voltage for V_{DD} in the <i>Pin Functions</i> table	4
• Changed supply voltage in the <i>Recommended Operating Conditions</i> table	5
• Changed values in the <i>Thermal Information</i> table.....	5
• Changed supply voltage in the conditions statement of the <i>Electrical Characteristics</i> table	5
• Removed two rows and all test conditions in the <i>LOGIC INPUTS</i> section of the <i>Electrical Characteristics</i> table.....	6
• Changed supply voltage in the <i>POWER REQUIREMENTS</i> section of the <i>Electrical Characteristics</i> table	6
• Changed test conditions for supply current in the <i>POWER REQUIREMENTS</i> section of the <i>Electrical Characteristics</i> table	6
• Changed V_{DD} in the condition statement and test conditions of the <i>Timing Requirements</i> ⁽¹⁾⁽²⁾ section	7
• Changed MIN value for SCLK low time in the <i>Timing Requirements</i> ⁽¹⁾⁽²⁾ section	7
• Added text in the <i>Application Information</i> section	17
• Changed supply voltage in the <i>Power Supply Recommendations</i> section	21
• Added new <i>Receiving Notification of Documentation Updates</i> section.....	22

Changes from Original (February 2016) to Revision A	Page
• Changed data sheet from PRODUCT PREVIEW to PRODUCTON DATA	1

5 Pin Configuration and Functions

Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
D _{IN}	7	I	Serial data input. Data is clocked into the 24-bit input shift register on each falling edge of the serial clock input. Schmitt-trigger logic input.
GND	8	GND	Ground reference point for all circuitry on the device
SCLK	6	I	Serial clock input. Data can be transferred at rates up to 30 MHz. Schmitt-trigger logic input.
$\overline{\text{SYNC}}$	5	I	Level-triggered control input (active-low). This is the frame synchronization signal for the input data. $\overline{\text{SYNC}}$ going low enables the input shift register, and data is transferred in on the falling edges of the following clocks. The DAC is updated following the 24th clock (unless $\overline{\text{SYNC}}$ is taken high before this edge, in which case the rising edge of $\overline{\text{SYNC}}$ acts as an interrupt, and the write sequence is ignored by the device). Schmitt-trigger logic input.
V _{DD}	1	PWR	Power supply input, 3 V to 5.5 V
V _{FB}	3	I	Feedback connection for the output amplifier. For voltage output operation, tie to V _{OUT} externally.
V _{OUT}	4	O	Analog output voltage from DAC. The output amplifier has rail-to-rail operation.
V _{REF}	2	I	Reference voltage input

6 Specifications

6.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted)⁽¹⁾

	MIN	MAX	UNIT
V _{DD} to GND	-0.3	6	V
Digital input voltage to GND D _{IN} , SCLK and $\overline{\text{SYNC}}$	-0.3	V _{DD} + 0.3	V
V _{OUT} to GND	-0.3	V _{DD} + 0.3	V
V _{REF} to GND	-0.3	V _{DD} + 0.3	V
V _{FB} to GND	-0.3	V _{DD} + 0.3	V
Junction temperature range, T _J max	-65	150	°C
Storage temperature, T _{stg}	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

		VALUE	UNIT	
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	±2000	
		Charged-device model (CDM), per AEC Q100-011	All pins	±500
			Corner pins (1, 4, 5, and 8)	±750

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
POWER SUPPLY					
Supply voltage	V _{DD} to GND	3		5.5	V
DIGITAL INPUTS					
Digital input voltage	D _{IN} , SCLK and SYNC	0		V _{DD}	V
REFERENCE INPUT					
V _{REF}	Reference input voltage	0		V _{DD}	V
AMPLIFIER FEEDBACK INPUT					
V _{FB}	Output amplifier feedback input		V _{OUT}		V
TEMPERATURE RANGE					
T _A	Operating ambient temperature	–40		125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		DAC8551-Q1 DAC6551-Q1	UNIT
		DGK (VSSOP)	
		8 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	173.7	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	65.4	°C/W
R _{θJB}	Junction-to-board thermal resistance	94.2	°C/W
ψ _{JT}	Junction-to-top characterization parameter	10.2	°C/W
ψ _{JB}	Junction-to-board characterization parameter	92.7	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

V_{DD} = 3 V to 5.5 V, V_{REF} = V_{DD} and T_A = –40°C to 125°C, unless otherwise noted.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
STATIC PERFORMANCE⁽¹⁾

7 Detailed Description

7.1 Overview

The DAC8551-Q1 and DAC6551-Q1 are small, low-power, voltage-output, 16- and 12-bit digital-to-analog converters (DACs) qualified for automotive applications. The DACx551-Q1 devices provide good linearity and minimize undesired code-to-code transient voltages. The devices use a versatile 3-wire serial interface that operates at clock rates to 30 MHz and is compatible with standard SPI, QSPI, Microwire, and digital signal processor (DSP) interfaces.

The DACx551-Q1 devices require an external reference voltage to set the output range. The devices incorporate a power-on-reset circuit that ensures the DAC output powers up at 0 V and remains there until a valid write to the device takes place. The devices contain a power-down feature, accessed over the serial interface, that reduces the current consumption to 800 nA at 5 V.

The DACx551-Q1 devices power consumption is only 800 μW at 5 V, reducing to less than 4 μW in power-down mode. The DACx551-Q1 devices are available in a VSSOP-8 package.

7.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

7.3 Feature Description

7.3.1 DAC Section

The DACx551-Q1 architecture consists of a string DAC followed by an output buffer amplifier. Figure 27 shows a block diagram of the DAC architecture.

Copyright © 2016, Texas Instruments Incorporated

Figure 27. DACx551-Q1 Architecture

The input coding to the DACx551-Q1 is straight binary, so the ideal output voltage is given by:

$$V_{OUT} = \frac{D_{IN}}{2^{n-1}} \times V_{REF} \quad (1)$$

Feature Description (continued)

where:

- n = resolution in bits; 12 (DAC6551-Q1) or 16 (DAC8551-Q1)
- D_{IN} = decimal equivalent of the binary code that is loaded to the DAC register; it can range from 0 to $2^n - 1$.

7.3.1.1 Resistor String

The resistor string section is shown in [Figure 28](#). It is simply a string of resistors, each of value R . The code loaded into the DAC register determines at which node on the string the voltage is tapped off to be fed into the output amplifier by closing one of the switches connecting the string to the amplifier.

Figure 28. Resistor String

7.3.1.2 Output Amplifier

The output buffer amplifier is capable of generating rail-to-rail voltages on its output, giving an output range of 0 V to V_{DD} . It is capable of driving a load of 2 k Ω in parallel with 1000 pF to GND. The source and sink capabilities of the output amplifier can be seen in the [Typical Characteristics](#). The slew rate is 1.4 V/ μ s with a full-scale setting time of 8 μ s with the output unloaded.

The inverting input of the output amplifier is brought out to the V_{FB} pin. This configuration allows for better accuracy in critical applications by tying the V_{FB} point and the amplifier output together directly at the load. Other signal conditioning circuitry may also be connected between these points for specific applications.

7.3.2 Power-On Reset

The DACx551-Q1 contains a power-on-reset circuit that controls the output voltage during power up. On power up, the DAC registers are filled with zeros and the output voltages are 0 V; they remain that way until a valid write sequence is made to the DAC. The power-on reset is useful in applications where it is important to know the state of the output of the DAC while it is in the process of powering up.

7.4 Device Functional Modes

7.4.1 Power-Down Modes

The DACx551-Q1 supports four separate modes of operation. These modes are programmable by setting two bits (PD1 and PD0) in the control register. Table 1 shows how the state of the bits corresponds to the mode of operation of the device.

Table 1. Operating Modes

PD1 (DB17)	PD0 (DB16)	OPERATING MODE
0	0	Normal operation
—	—	Power-down modes
0	1	Output typically 1 kΩ to GND
1	0	Output typically 100 kΩ to GND
1	1	High-Z

When both bits are set to 0, the device works normally with its typical current consumption of 160 μA at 5 V. However, for the three power-down modes, the supply current falls to 800 nA at 5 V. Not only does the supply current fall, but the output stage is also internally switched from the output of the amplifier to a resistor network of known values. This configuration has the advantage that the output impedance of the device is known while it is in power-down mode. There are three different options. The output is connected internally to GND through a 1-kΩ resistor, a 100-kΩ resistor, or it is left open-circuited (High-Z). The output stage is illustrated in Figure 29.

Copyright © 2016, Texas Instruments Incorporated

Figure 29. Output Stage During Power Down

All analog circuitry is shut down when the power-down mode is activated. However, the contents of the DAC register are unaffected when in power down. The time to exit power-down is typically 2.5 μs for $V_{DD} = 5\text{ V}$, and 5 μs for $V_{DD} = 3\text{ V}$. See the [Typical Characteristics](#) for more information.

7.5 Programming

The DAC8551-Q1 and DAC6551-Q1 devices have a 3-wire serial interface ($\overline{\text{SYNC}}$, SCLK, and D_{IN}), which is compatible with SPI, QSPI, and Microwire interface standards, as well as most DSPs. See the [Serial Write Operation Timing Diagram](#) section for an example of a typical write sequence.

The input shift register is 24 bits wide, as shown in [Figure 30](#) and [Figure 31](#). The first six bits are *don't care* bits. The next two bits (PD1 and PD0) are control bits that control which mode of operation the part is in (normal mode or any one of three power-down modes). A more complete description of the various modes is located in the [Power-Down Modes](#) section. The next 16 bits are the left aligned data bits. These bits are transferred to the DAC register on the 24th falling edge of SCLK.

DB23																		DB0					
X	X	X	X	X	X	PD1	PD0	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0

Figure 31. DAC6551-Q1 Data-Input Register Format

The write sequence begins by bringing the $\overline{\text{SYNC}}$ line low. Data from the D_{IN} line are clocked into the 24-bit shift register on each falling edge of SCLK. The serial clock frequency can be as high as 30 MHz, making the devices compatible with high-speed DSPs. On the 24th falling edge of the serial clock, the last data bit is clocked in and the programmed function is executed (that is, a change in DAC register contents and/or a change in the mode of operation).

At this point, the $\overline{\text{SYNC}}$ line may be kept low or brought high. In either case, it must be brought high for a minimum of 33 ns before the next write sequence so that a falling edge of $\overline{\text{SYNC}}$ can initiate the next write sequence. As previously mentioned, it must be brought high again just before the next write sequence.

7.5.1 $\overline{\text{SYNC}}$ Interrupt

In a normal write sequence, the $\overline{\text{SYNC}}$ line is kept low for at least 24 falling edges of SCLK, and the DAC is updated on the 24th falling edge. However, if $\overline{\text{SYNC}}$ is brought high before the 24th falling edge, it acts as an interrupt to the write sequence. The shift register is reset, and the write sequence is seen as invalid. Neither an update of the DAC register contents nor a change in the operating mode occurs, as shown in [Figure 32](#).

Figure 32. $\overline{\text{SYNC}}$ Interrupt Facility

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The DAC8551-Q1 and DAC6551-Q1 devices are AEC-Q100 qualified, low-power, ultralow-glitch, 16-bit and 12-bit DACs, respectively. The wide temperature range, low-power consumption and very low glitch of the devices make them a great choice for automotive applications such as radar and sensor conditioning.

8.2 Typical Applications

8.2.1 Loop-Powered 2-Wire 4-mA to 20-mA Transmitter With XTR116

Figure 33. Loop-Powered Transmitter

8.2.1.1 Design Requirements

This design is commonly referred to as a loop-powered, or 2-wire, 4 mA to 20 mA transmitter. The transmitter has only two external input terminals: a supply connection and an output, or return, connection. The transmitter communicates back to its host, typically a PLC analog input module, by precisely controlling the magnitude of its return current. In order to conform to the 4 mA to 20 mA communication standard, the complete transmitter must consume less than 4 mA of current. The DAC8551-Q1 device enables the accurate control of the loop current from 4 mA to 20 mA in 16-bit steps.

8.2.1.2 Detailed Design Procedure

Although it is possible to recreate the loop-powered circuit using discrete components, the XTR116 provides simplicity and improved performance due to the matched internal resistors. The output current can be modified if necessary by looking using Equation 2.

$$I_{OUT}(\text{Code}) = \left(\frac{V_{ref} \times \text{Code}}{2^N \times R_3} + \frac{V_{REG}}{R_1} \right) \times \left(1 + \frac{2475 \Omega}{25 \Omega} \right) \quad (2)$$

Typical Applications (continued)

For more details of this application, see *2-wire, 4-20mA Transmitter, EMC/EMI Tested Reference Design (TIDUA07)*. It covers in detail the design of this circuit as well as how to protect it from EMC/EMI tests.

8.2.1.3 Application Curves

Total unadjusted error (TUE) is a good estimate for the performance of the output as shown in [Figure 34](#). The linearity of the output or INL is in [Figure 35](#).

8.2.2 Bipolar Operation Using the DAC8551-Q1 Device

The DAC8551-Q1 device has been designed for single-supply operation, but a bipolar output range is also possible using the circuit in [Figure 36](#). The circuit shown gives an output voltage range of $\pm V_{REF}$. Rail-to-rail operation at the amplifier output is achievable using an [OPA703](#) as the output amplifier.

Figure 36. Bipolar Output Range

The output voltage for any input code can be calculated as follows:

$$V_O = \left[V_{REF} \times \left(\frac{D}{65536} \right) \times \left(\frac{R_1 + R_2}{R_1} \right) - V_{REF} \times \left(\frac{R_2}{R_1} \right) \right] \quad (3)$$

where D represents the input code in decimal (0–65,535)

with $V_{REF} = 5V$, $R_1 = R_2 = 10\text{ k}\Omega$.

$$V_O = \left(\frac{10 \times D}{65536} \right) - 5\text{ V} \quad (4)$$

Using this example, an output voltage range of ± 5 V with 0000h corresponding to a -5 V output and FFFFh corresponding to a 5 V output can be achieved. Similarly, using $V_{REF} = 2.5$ V, a ± 2.5 V output voltage range can be achieved.

8.2.3 Using the REF02 As a Power Supply for the DACx551-Q1

Due to the extremely low supply current required by the DACx551-Q1, an alternative option is to use a precision reference such as the REF02 device to supply the required voltage to the device, as illustrated in Figure 37.

Figure 37. REF02 As a Power Supply to the DACx551-Q1

This configuration is especially useful if the power supply is quite noisy or if the system supply voltages are at some value other than 5 V. The REF02 device outputs a steady supply voltage for the device. If the REF02 device is used, the current it must supply to the device is $200 \mu\text{A}$. This configuration is with no load on the output of the DAC. When a DAC output is loaded, the REF02 also must supply the current to the load.

The total current required (with a $5 \text{ k}\Omega$ load on the DAC output) is:

$$200\mu\text{A} + \frac{5\text{V}}{5\text{k}\Omega} = 1.2\text{mA} \quad (5)$$

The load regulation of the REF02 is typically $0.005\%/mA$, resulting in an error of $299 \mu\text{V}$ for the 1.2 mA current drawn from it. This value corresponds to a 3.9 LSB error.

8.3 System Examples

8.3.1 Interface From the DACx551-Q1 to 8051

See [Figure 38](#) for a serial interface between the DACx551-Q1 and a typical 8051-type microcontroller. The setup for the interface is as follows: TXD of the 8051 drives SCLK of the DACx551-Q1, whereas RXD drives the serial data line of the device. The $\overline{\text{SYNC}}$ signal is derived from a bit-programmable pin on the port of the 8051. In this case, port line P3.3 is used. When data are to be transmitted to the DACx551-Q1, P3.3 is taken low. The 8051 transmits data in 8-bit bytes; thus, only eight falling clock edges occur in the transmit cycle. To load data to the DAC, P3.3 is left low after the first eight bits are transmitted, then a second write cycle is initiated to transmit the second byte of data. P3.3 is taken high following the completion of the third write cycle. The 8051 outputs the serial data in a format that has the LSB first. The DACx551-Q1 requires data with the MSB as the first bit received. Therefore, the 8051 transmit routine must take this into account, and *mirror* the data as needed.

NOTE: (1) Additional pins omitted for clarity.

Figure 38. Interface From the DACx551-Q1 to 80C51 or 80L51

8.3.2 Interface From the DACx551-Q1 to Microwire

[Figure 39](#) shows an interface between the DACx551-Q1 and any Microwire-compatible device. Serial data are shifted out on the falling edge of the serial clock and is clocked into the DACx551-Q1 on the rising edge of the SK signal.

NOTE: (1) Additional pins omitted for clarity.

Figure 39. Interface From the DACx551-Q1 to Microwire

8.3.3 Interface From the DACx551-Q1 to 68HC11

[Figure 40](#) shows a serial interface between the DACx551-Q1 and the 68HC11 microcontroller. SCK of the 68HC11 drives SCLK of the DACx551-Q1, whereas the MOSI output drives the serial data line of the DAC. The SYNC signal is derived from a port line (PC7), similar to the 8051 diagram.

NOTE: (1) Additional pins omitted for clarity.

Figure 40. Interface From the DACx551-Q1 to 68HC11

The 68HC11 should be configured so that its CPOL bit is 0 and its CPHA bit is 1. This configuration causes data appearing on the MOSI output to be valid on the falling edge of SCK. When data are being transmitted to the DAC, the SYNC line is held low (PC7). Serial data from the 68HC11 are transmitted in 8-bit bytes with only eight falling clock edges occurring in the transmit cycle. (Data are transmitted MSB first.) In order to load data to the DACx551-Q1, PC7 is left low after the first eight bits are transferred, then a second and third serial write operation are performed to the DAC. PC7 is taken high at the end of this procedure.

9 Power Supply Recommendations

The DACx551-Q1 can operate within the specified supply voltage range of 3 V to 5.5 V. The power applied to V_{DD} should be well-regulated and low-noise. Switching power supplies and dc/dc converters often have high-frequency glitches or spikes riding on the output voltage. In addition, digital components can create similar high-frequency spikes. This noise can easily couple into the DAC output voltage through various paths between the power connections and analog output. In order to further minimize noise from the power supply, a strong recommendation is to include a 1- μ F to 10- μ F capacitor and 0.1- μ F bypass capacitor. The current consumption on the V_{DD} pin, the short-circuit current limit, and the load current for the device is listed in the Electrical Characteristics table. The power supply must meet the aforementioned current requirements.

10 Layout

10.1 Layout Guidelines

A precision analog component requires careful layout, adequate bypassing, and clean, well-regulated power supplies.

The DACx551-Q1 offers single-supply operation, and is often used in close proximity with digital logic, microcontrollers, microprocessors, and digital signal processors. The more digital logic present in the design and the higher the switching speed, the more difficult it is to keep digital noise from appearing at the output.

Due to the single ground pin of the DACx551-Q1, all return currents, including digital and analog return currents for the DAC, must flow through a single point. Ideally, GND would be connected directly to an analog ground plane. This plane would be separate from the ground connection for the digital components until they were connected at the power-entry point of the system.

As with the GND connection, V_{DD} should be connected to a power-supply plane or trace that is separate from the connection for digital logic until they are connected at the power-entry point. In addition, a 1 μ F to 10 μ F capacitor and 0.1 μ F bypass capacitor are strongly recommended. In some situations, additional bypassing may be required, such as a 100 μ F electrolytic capacitor or even a *Pi* filter made up of inductors and capacitors—all designed to essentially low-pass filter the 5 V supply, removing the high-frequency noise.

11.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.4 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

11.5 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most-current data available for the designated devices. This data is subject to change without notice and without revision of this document. For browser-based versions of this data sheet, see the left-hand navigation pane.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DAC6551AQDGKRQ1	ACTIVE	VSSOP	DGK	8	2500	Green (RoHS & no Sb/Br)	CU NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	D61Q	Samples
DAC8551AQDGKRQ1	ACTIVE	VSSOP	DGK	8	2500	Green (RoHS & no Sb/Br)	CU NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	D81Q	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 per end.
 - D. Body width does not include interlead flash. Interlead flash shall not exceed 0.50 per side.
 - E. Falls within JEDEC MO-187 variation AA, except interlead flash.

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
