

LM3674 2-MHz, 600-mA Step-Down DC-DC Converter in SOT-23

1 Features

- Input Voltage Range From 2.7 V to 5.5 V
- 600-mA Maximum Load Current
- Available in Fixed and Adjustable Output Voltages Ranging From 1 V to 3.3 V
- Operates From a Single Li-Ion Cell Battery
- Internal Synchronous Rectification for High Efficiency
- Internal Soft-Start
- 0.01- μ A Typical Shutdown Current
- 2-MHz PWM Fixed Switching Frequency (typical)
- Current Overload Protection and Thermal Shutdown Protection

2 Applications

- Mobile Phones
- PDAs
- MP3 Players
- Portable Instruments
- W-LAN
- Digital Still Cameras
- Portable Hard Disk Drives

3 Description

The LM3674 step-down DC-DC converter is optimized for powering low-voltage circuits from a single Li-Ion cell battery and input voltage rails from 2.7 V to 5.5 V. It provides up to 600-mA load current over the entire input voltage range. There are several fixed output voltages and adjustable output voltage versions.

The device offers superior features and performance for mobile phones and similar portable systems. During the Pulse Width Modulation (PWM) mode, the device operates at a fixed-frequency of 2 MHz (typical). Internal synchronous rectification provides high efficiency during the PWM mode operation. In shutdown mode, the device turns off and reduces battery consumption to 0.01 μ A (typical).

The LM3674 is available in a 5-pin SOT-23 package. A high switching frequency of 2 MHz (typical) allows use of only three tiny external surface-mount components, an inductor and two ceramic capacitors.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LM3674	SOT-23 (5)	2.90 mm x 1.60 mm

5 Pin Configuration and Functions

Note: The actual physical placement of the package marking will vary from part to part.

Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NUMBER		
EN	3	Digital	Enable input. The device is in shutdown mode when voltage to this pin is < 0.4 V and enable when > 1 V. Do not leave this pin floating.
FB	4	Analog	Feedback analog input. Connect to the output filter capacitor, C _{OUT} , for fixed voltage versions. For adjustable version, external resistor dividers are required (R ₁ and R ₂). The internal resistor dividers are disabled for the adjustable version.
GND	2	Ground	Ground pin
SW	5	Analog	Switching node connection to the internal PFET switch and NFET synchronous rectifier.
V _{IN}	1	Power	Power supply input. Connect to the input filter capacitor, C _{IN} .

6 Specifications

6.1 Absolute Maximum Ratings

 over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾

	MIN	MAX	UNIT
V _{IN} pin: voltage to GND	-0.2	6	V
EN, FB, and SW pins	GND - 0.2	V _{IN} + 0.2	V
Continuous power dissipation ⁽³⁾	Internally Limited		
Junction temperature (T _{J-MAX})		125	°C
Maximum lead temperature (soldering, 10 seconds)		260	°C
Storage temperature, T _{stg}	-65		°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) If Military- or Aerospace-specified devices are required, please contact the TI Sales Office/Distributors for availability and specifications.
- (3) In applications where high power dissipation and/or poor package resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature (T_{A-MAX}) is dependent on the maximum operating junction temperature (T_{J-MAX}), the maximum power dissipation of the device in the application (P_{D-MAX}) and the junction-to-ambient thermal resistance of the package (R_{θJA}) in the application, as given by the following equation: T_{A-MAX} = T_{J-MAX} - (R_{θJA} × P_{D-MAX}). See *Dissipation Ratings* for P_{D-MAX} values at different ambient temperatures.

6.2 ESD Ratings

		VALUE	UNIT	
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±200	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

 over operating free-air temperature range (unless otherwise noted)⁽¹⁾

	MIN	MAX	UNIT
Input voltage ⁽²⁾	2.7	5.5	V
Recommended load current	0	600	mA
Junction temperature, T _J	-30	125	°C
Ambient temperature, T _A	-30	85	°C

- (1) All voltages are with respect to the potential at the GND pin.
- (2) Input voltage range recommended for ideal applications performance for the specified output voltages are given below:
 V_{IN} = 2.7 V to 5.5 V for 1 V ≤ V_{OUT} < 1.8 V
 V_{IN} = (V_{OUT} + V_{DROP OUT}) to 5.5 V for 1.8 ≤ V_{OUT} ≤ 3.3 V, where V_{DROP OUT} = I_{LOAD} × (R_{DSON (P)} + R_{INDUCTOR})

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LM3674	UNIT	
		DBV (SOT-23)		
		5 PINS		
R _{θJA}	Junction-to-ambient thermal resistance	4-layer board	130	°C/W
		2-layer board	250	

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

6.5 Dissipation Ratings

over operating free-air temperature range (unless otherwise noted)

R _{θJA}	T _A ≤ 25°C (POWER RATING)	T _A = 60°C (POWER RATING)	T _A = 85°C (POWER RATING)
250°C/W (2-layer board)	400 mW	260 mW	160 mW
130°C/W (4-layer board)	770 mW	500 mW	310 mW

6.6 Electrical Characteristics

Typical limits are $T_A = 25^\circ\text{C}$; unless otherwise noted, specifications apply to the LM3674 with $V_{IN} = EN = 3.6\text{ V}$ ⁽¹⁾⁽²⁾⁽³⁾

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{FB}	Feedback voltage ⁽⁴⁾⁽⁵⁾	$I_O = 10\text{ mA}$, $-30^\circ\text{C} \leq T_J \leq 125^\circ\text{C}$	-4%		4%	
	Line regulation	$2.7\text{ V} \leq V_{IN} \leq 5.5\text{ V}$, $I_O = 100\text{ mA}$		0.083		%/V
	Load regulation	$100\text{ mA} \leq I_O \leq 600\text{ mA}$, $V_{IN} = 3.6\text{ V}$		0.0010		%/mA
V_{REF}	Internal reference voltage	See ⁽⁶⁾		0.5		V
I_{SHDN}	Shutdown supply current	$EN = 0\text{ V}$		0.01		μA
		$EN = 0\text{ V}$, $-30^\circ\text{C} \leq T_J \leq 125^\circ\text{C}$			1	
I_Q	DC bias current into V_{IN}	No load, device is not switching ($FB = 0\text{ V}$)		300		μA
		No load, device is not switching ($FB = 0\text{ V}$) $-30^\circ\text{C} \leq T_J \leq 125^\circ\text{C}$			600	
$R_{DSON(P)}$	Pin-to-pin resistance for PFET	$I_{SW} = 200\text{ mA}$		380	500	$\text{m}\Omega$
$R_{DSON(N)}$	Pin-to-pin resistance for NFET	$I_{SW} = 200\text{ mA}$		250	400	$\text{m}\Omega$
I_{LIM}	Switch peak current limit	Open loop ⁽⁷⁾		1020		mA
		Open loop ⁽⁷⁾ , $-30^\circ\text{C} \leq T_J \leq 125^\circ\text{C}$	830		1200	
V_{IH}	Logic high input	$-30^\circ\text{C} \leq T_J \leq 125^\circ\text{C}$	1			V
V_{IL}	Logic low input	$-30^\circ\text{C} \leq T_J \leq 125^\circ\text{C}$			0.4	V
I_{EN}	Enable (EN) input current			0.01		μA
		$-30^\circ\text{C} \leq T_J \leq 125^\circ\text{C}$			1	
F_{OSC}	Internal oscillator frequency	PWM mode		2		MHz
		PWM mode, $-30^\circ\text{C} \leq T_J \leq 125^\circ\text{C}$	1.6		2.6	

- (1) All voltages are with respect to the potential at the GND pin.
- (2) Minimum and maximum limits are specified by design, test, or statistical analysis. Typical numbers represent the most likely values.
- (3) The parameters in the *Electrical Characteristics* are tested at $V_{IN} = 3.6\text{ V}$ unless otherwise specified. For performance curves over the input voltage range, see *Typical Characteristics*.
- (4) ADJ configured to 1.5-V output.
- (5) For $V_{OUT} < 2.5\text{ V}$, $V_{IN} = 3.6\text{ V}$; for $V_{OUT} \geq 2.5\text{ V}$, $V_{IN} = V_{OUT} + 1$.
- (6) For the ADJ version the resistor dividers should be selected such that at the desired output voltage, the voltage at the FB pin is 0.5 V.
- (7) See *Typical Characteristics* for closed loop data and its variation with regards to supply voltage and temperature. *Electrical Characteristics* reflect open loop data ($FB = 0\text{ V}$ and current drawn from the SW pin ramped up until cycle-by-cycle current limit is activated). Closed-loop current limit is the peak inductor current measured in the application circuit by increasing output current until output voltage drops by 10%.

7 Detailed Description

7.1 Overview

The LM3674, a high-efficiency, step-down, DC-DC switching buck converter, delivers a constant voltage from a single Li-Ion battery and input voltage rails from 2.7 V to 5.5 V to portable devices such as cell phones and PDAs. Using a voltage mode architecture with synchronous rectification, the LM3674 has the ability to deliver up to 600 mA depending on the input voltage, output voltage, ambient temperature, and the inductor chosen.

Additional features include soft-start, undervoltage protection, current overload protection, and thermal overload protection. As shown in *Typical Application Circuit*, only three external power components, C_{IN} , C_{OUT} , and L_1 , are required for implementation.

The part uses an internal reference voltage of 0.5 V. It is recommended to keep the part in shutdown mode until the input voltage is 2.7 V or higher.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Circuit Operation

During the first portion of each switching cycle, the control block in the LM3674 turns on the internal PFET switch. This allows current to flow from the input through the inductor to the output filter capacitor and load. The inductor limits the current to a ramp with a slope of:

$$\frac{V_{IN} - V_{OUT}}{L} \quad (1)$$

by storing energy in a magnetic field. During the second portion of each cycle, the controller turns the PFET switch off, blocking current flow from the input, and then turns the NFET synchronous rectifier on. The inductor draws current from ground through the NFET to the output filter capacitor and load, which ramps the inductor current down with a slope of:

$$\frac{-V_{OUT}}{L} \quad (2)$$

The output filter stores charge when the inductor current is high, and releases it when the inductor current is low, smoothing the voltage across the load.

The output voltage is regulated by modulating the PFET switch-on time to control the average current sent to the load. The effect is identical to sending a duty-cycle modulated rectangular wave formed by the switch and synchronous rectifier at the SW pin to a low-pass filter formed by the inductor and output filter capacitor. The output voltage is equal to the average voltage at the SW pin.

7.3.2 PWM Operation

During PWM operation, the converter operates as a voltage-mode controller with input voltage feed-forward. This allows the converter to achieve excellent load and line regulation. The DC gain of the power stage is proportional to the input voltage. To eliminate this dependence, feed-forward inversely proportional to the input voltage is introduced.

While in PWM mode, the output voltage is regulated by switching at a constant frequency and then modulating the energy per cycle to control power to the load. At the beginning of each clock cycle, the PFET switch is turned on and the inductor current ramps up until the comparator trips and the control logic turns off the switch.

The current limit comparator can also turn off the switch in case the current limit of the PFET is exceeded. Then the NFET switch is turned on and the inductor current ramps down. The next cycle is initiated by the clock turning off the NFET and turning on the PFET.

Figure 18. PWM Operation

Feature Description (continued)

7.3.2.1 Internal Synchronous Rectification

While in PWM mode, the LM3674 uses an internal NFET as a synchronous rectifier to reduce rectifier forward voltage drop and associated power loss. Synchronous rectification provides a significant improvement in efficiency whenever the output voltage is relatively low compared to the voltage drop across an ordinary rectifier diode.

7.3.2.2 Current Limiting

A current limit feature allows the LM3674 to protect itself and external components during overload conditions. PWM mode implements current limiting using an internal comparator that trips at 1020 mA (typical). If the output is shorted to ground, then the device enters a timed current-limit mode where the NFET is turned on for a longer duration until the inductor current falls below a low threshold, ensuring inductor current has more time to decay, and thereby preventing runaway.

7.4 Device Functional Modes

There are two modes of operation depending on the current required: Pulse Width Modulation (PWM) and shutdown. The device operates in PWM mode throughout the I_{OUT} range. Shutdown mode turns off the device, offering the lowest current consumption ($I_{SHUTDOWN} = 0.01 \mu\text{A}$, typical). Additional features include soft-start, undervoltage protection, and current overload protection.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Soft-Start

The LM3674 has a soft-start circuit that limits in-rush current during start-up. During start-up the switch current limit is increased in steps. Soft-start is activated only if EN goes from logic low to logic high after V_{IN} reaches 2.7 V. Soft-start is implemented by increasing switch current limit in steps of 70 mA, 140 mA, 280 mA, and 1020 mA (typical switch current limit). The start-up time thereby depends on the output capacitor and load current demanded at start-up. Typical start-up times with 10- μ F output capacitor and a 300-mA load current is 350 μ s and with a 10-mA load current is 240 μ s.

8.1.2 Low-Dropout (LDO) Operation

The LM3674-ADJ can operate at 100% duty-cycle (no switching, PMOS switch completely on) for low-dropout support of the output voltage. In this way the output voltage will be controlled down to the lowest possible input voltage. When the device operates near 100% duty-cycle, the output voltage supply ripple is slightly higher, approximately 25 mV.

The minimum input voltage needed to support the output voltage is:

$$V_{IN,MIN} = I_{LOAD} \times (R_{DSON(P)} + R_{INDUCTOR}) + V_{OUT}$$

where:

- I_{LOAD} is load current
- $R_{DSON(P)}$ is drain-to-source resistance of PFET switch in the triode region
- $R_{INDUCTOR}$ is inductor resistance

(3)

8.2 Typical Applications

8.2.1 Typical Application for Fixed Voltage Configuration

Figure 19. Fixed-Voltage Typical Application Circuit

8.2.1.1 Design Requirements

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage	3.6 V
Output voltage	1.5 V
Output current	300 mA

8.2.1.2 Detailed Design Procedure

8.2.1.2.1 Inductor Selection

There are two main considerations when choosing an inductor:

- The inductor should not saturate.
- The inductor current ripple should be small enough to achieve the desired output voltage ripple.

Different saturation current rating specifications are followed by different manufacturers so attention must be given to details. Saturation current ratings are typically specified at 25°C. However, ratings at the maximum ambient temperature of the application should be requested from the manufacturer. The minimum value of inductance to ensure good performance is 1.76 μH at I_{LIM} (typical) DC current over the ambient temperature range. Shielded inductors radiate less noise and should be preferred.

There are two methods to choose the inductor saturation current rating:

Method 1:

The saturation current is greater than the sum of the maximum load current and the worst case average to peak inductor current. This can be written as:

$$I_{\text{SAT}} > I_{\text{OUTMAX}} + I_{\text{RIPPLE}} \quad (4)$$

$$\text{where } I_{\text{RIPPLE}} = \left(\frac{V_{\text{IN}} - V_{\text{OUT}}}{2 \times L} \right) \left(\frac{V_{\text{OUT}}}{V_{\text{IN}}} \right) \left(\frac{1}{f} \right)$$

and

- I_{RIPPLE} is average-to-peak inductor current
 - I_{OUTMAX} is maximum load current (600 mA)
 - V_{IN} is maximum input voltage in application
 - L is minimum inductor value including worst case tolerances (30% drop can be considered for method 1)
 - f is minimum switching frequency (1.6 MHz)
 - V_{OUT} is output voltage
- (5)

Method 2:

A more conservative and recommended approach is to choose an inductor that has saturation current rating greater than the maximum current limit of 1200 mA.

A 2.2- μH inductor with a saturation current rating of at least 1200 mA is recommended for most applications. The resistance of the inductor should be less than 0.3 Ω for good efficiency. [Table 1](#) lists suggested inductors and suppliers. For low-cost applications, an unshielded bobbin inductor is suggested. For noise critical applications, a toroidal or shielded-bobbin inductor should be used. A good practice is to lay out the board with overlapping footprints of both types for design flexibility. This allows substitution of a low-noise toroidal inductor in the event that noise from low-cost bobbin models is unacceptable.

Table 1. Suggested Inductors and Their Suppliers

MODEL	VENDOR	DIMENSIONS LxWxH (mm)	D.C.R (maximum) (m Ω)
DO3314-222MX	Coilcraft	3.3 x 3.3 x 1.4	200
LPO3310-222MX	Coilcraft	3.3 x 3.3 x 1.0	150
ELL5GM2R2N	Panasonic	5.2 x 5.2 x 1.5	53
CDRH2D14NP-2R2NC	Sumida	3.2 x 3.2 x 1.55	94

8.2.1.2.2 Input Capacitor Selection

A ceramic input capacitor of 4.7 μF , 6.3 V is sufficient for most applications. Place the input capacitor as close as possible to the V_{IN} pin of the device. A larger value may be used for improved input voltage filtering. Use X7R or X5R types; do not use Y5V. DC bias characteristics of ceramic capacitors must be considered when selecting case sizes like 0805 and 0603. The minimum input capacitance to ensure good performance is 2.2 μF at 3-V DC bias; 1.5 μF at 5-V DC bias including tolerances and over ambient temperature range. The input filter capacitor supplies current to the PFET switch of the LM3674 in the first half of each cycle and reduces voltage ripple imposed on the input power source. The low equivalent series resistance (ESR) of a ceramic capacitor provides the best noise filtering of the input voltage spikes due to this rapidly changing current. Select a capacitor with sufficient ripple current rating. The input current ripple can be calculated as:

$$I_{\text{RMS}} = I_{\text{OUTMAX}} \times \sqrt{\frac{V_{\text{OUT}}}{V_{\text{IN}}} \times \left(1 - \frac{V_{\text{OUT}}}{V_{\text{IN}}} + \frac{r^2}{12}\right)}$$

$$r = \frac{(V_{\text{IN}} - V_{\text{OUT}}) \times V_{\text{OUT}}}{L \times f \times I_{\text{OUTMAX}} \times V_{\text{IN}}} \quad \text{The worst case is when } V_{\text{IN}} = 2 \times V_{\text{OUT}} \quad (6)$$

8.2.1.2.3 Output Capacitor Selection

A ceramic output capacitor of 10 μF , 6.3 V is sufficient for most applications. Use X7R or X5R types; do not use Y5V. DC bias characteristics of ceramic capacitors must be considered when selecting case sizes like 0805 and 0603. DC-bias characteristics vary from manufacturer to manufacturer and DC-bias curves should be requested from them as part of the capacitor selection process.

The minimum output capacitance to ensure good performance is 5.75 μF at 1.8 V DC bias including tolerances and over ambient temperature range. The output filter capacitor smoothes out current flow from the inductor to the load, helps maintain a steady output voltage during transient load changes, and reduces output voltage ripple. These capacitors must be selected with sufficient capacitance and sufficiently low ESR to perform these functions.

The output voltage ripple is caused by the charging and discharging of the output capacitor and by the R_{ESR} and can be calculated as:

Voltage peak-to-peak ripple due to capacitance can be expressed as:

$$V_{\text{PP-C}} = \frac{I_{\text{ripple}}}{f \times 4 \times C} \quad (7)$$

Voltage peak-to-peak ripple due to ESR:

$$V_{\text{OUT}} = V_{\text{PP-ESR}} = I_{\text{PP}} \times R_{\text{ESR}} \quad (8)$$

Because these two components are out of phase, the root mean squared (rms) value can be used to get an approximate value of peak-to-peak ripple.

Voltage peak-to-peak ripple, rms:

$$V_{\text{PP-RMS}} = \sqrt{V_{\text{PP-C}}^2 + V_{\text{PP-ESR}}^2} \quad (9)$$

Note that the output ripple is dependent on the current ripple and the equivalent series resistance of the output capacitor (R_{ESR}).

The R_{ESR} is frequency-dependent (as well as temperature-dependent); make sure the value used for calculations is at the switching frequency of the part.

Table 2. Suggested Capacitors and Their Suppliers

MODEL	TYPE	VENDOR	VOLTAGE RATING (V)	CASE SIZE [Inch (mm)]

8.2.2 Typical Application Circuit for Adjustable Voltage Option

Figure 20. Typical Application Circuit for Adjustable Voltage Option Schematic

8.2.2.1 Design Requirements

DESIGN PARAMETER	EXAMPLE VALUE
Output voltage	1.5 V

8.2.2.2 Detailed Design Procedure

8.2.2.2.1 Output Voltage Selection for Adjustable (LM3674-ADJ)

The output voltage of the adjustable parts can be programmed through the resistor network connected from V_{OUT} to FB then to GND. V_{OUT} will be adjusted to make FB equal to 0.5 V. The resistor from FB to GND (R_2) should be 200 k Ω to keep the current drawn through this network small but large enough that it is not susceptible to noise. If R_2 is 200 k Ω , and given the V_{FB} is 0.5 V, then the current through the resistor feedback network will be 2.5 μ A. The output voltage formula is:

$$V_{OUT} = V_{FB} * \left(\frac{R_1}{R_2} + 1 \right)$$

where:

- V_{OUT} = Output voltage (V)
 - V_{FB} = Feedback voltage (0.5 V typical)
 - R_1 = Resistor from V_{OUT} to FB (Ω)
 - R_2 = Resistor from FB to GND (Ω)
- (10)

For any output voltage greater than or equal to 1.0 V, a frequency zero must be added at 45 kHz for stability. The formula is:

$$C_1 = \frac{1}{2 * \pi * R_1 * 45 \text{ kHz}}$$
(11)

For output voltages greater than or equal to 2.5 V, a pole must also be placed at 45 kHz as well. If the pole and zero are at the same frequency the formula for calculation of C_2 is:

$$C_2 = \frac{1}{2 * \pi * R_2 * 45 \text{ kHz}}$$
(12)

The formula for location of zero and pole frequency created by adding C_1, C_2 are given below. It can be seen that by adding C_1 , a zero as well as a higher frequency pole is introduced.

$$F_z = \frac{1}{(2 * \pi * R_1 * C_1)} \quad F_p = \frac{1}{2 * \pi * (R_1 || R_2) * (C_1 + C_2)}$$
(13)

See [Table 4](#).

9 Power Supply Recommendations

The LM3674 requires a single supply input voltage. This voltage can range between 2.7 V to 5.5 V and be able to supply enough current for a given application.

10 Layout

10.1 Layout Guidelines

PC board layout is an important part of DC-DC converter design. Poor board layout can disrupt the performance of a DC-DC converter and surrounding circuitry by contributing to EMI, ground bounce, and resistive voltage loss in the traces. These can send erroneous signals to the DC-DC converter device, resulting in poor regulation or instability.

Good layout for the LM3674 can be implemented by following a few simple design rules, as illustrated in [Figure 21](#).

1. Place the LM3674, inductor and filter capacitors close together and make the traces short. The traces between these components carry relatively high switching currents and act as antennas. Following this rule reduces radiated noise. Special care must be given to place the input filter capacitor very close to the V_{IN} and GND pin.
2. Arrange the components so that the switching current loops curl in the same direction. During the first half of each cycle, current flows from the input filter capacitor, through the LM3674 and inductor to the output filter capacitor and back through ground, forming a current loop. In the second half of each cycle, current is pulled up from ground, through the LM3674 by the inductor, to the output filter capacitor and then back through ground, forming a second current loop. Routing these loops so the current curls in the same direction prevents magnetic field reversal between the two half-cycles and reduces radiated noise.
3. Connect the ground pins of the LM3674, and filter capacitors together using generous component-side copper fill as a pseudo-ground plane. Then, connect this to the ground-plane (if one is used) with several vias. This reduces ground-plane noise by preventing the switching currents from circulating through the ground plane. It also reduces ground bounce at the LM3674 by giving it a low-impedance ground connection.
4. Use wide traces between the power components and for power connections to the DC-DC converter circuit. This reduces voltage errors caused by resistive losses across the traces.
5. Route noise sensitive traces, such as the voltage feedback path, away from noisy traces between the power components. The voltage feedback trace must remain close to the LM3674 circuit and should be direct but should be routed opposite to noisy components. This reduces the EMI radiated onto the voltage feedback trace of the DC-DC converter. A good approach is to route the feedback trace on another layer and to have a ground plane between the top layer and layer on which the feedback trace is routed. In the same manner for the adjustable part it is desired to have the feedback dividers on the bottom layer.
6. Place noise sensitive circuitry, such as radio IF blocks, away from the DC-DC converter, CMOS digital blocks

Layout Guidelines (continued)

and other noisy circuitry. Interference with noise-sensitive circuitry in the system can be reduced through distance.

In mobile phones, for example, a common practice is to place the DC-DC converter on one corner of the board, arrange the CMOS digital circuitry around it (because this also generates noise), and then place sensitive preamplifiers and IF stages on the diagonally opposing corner. Often, the sensitive circuitry is shielded with a metal pan and power to it is post-regulated to reduce conducted noise by using low-dropout linear regulators.

11 Device and Documentation Support

11.1 Device Support

11.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

11.2 Trademarks

All trademarks are the property of their respective owners.

11.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.4 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
