

## TPS7A4001 100-V Input Voltage, 50-mA, Very High Voltage Linear Regulator

### 1 Features

- Very High Maximum Input Voltage: 100 V
- Wide Input Voltage Range: 7 to 100 V
- Accuracy:
  - Nominal: 1%
  - Over Line, Load, and Temperature: 2.5%
- Low Quiescent Current: 25  $\mu$ A
- Quiescent Current at Shutdown: 4.1  $\mu$ A
- Maximum Output Current: 50 mA
- CMOS Logic-Level-Compatible Enable Pin
- Adjustable Output Voltage from about 1.175 to 90 V
- Stable With Ceramic Capacitors:
  - Input Capacitance:  $\geq 1$   $\mu$ F
  - Output Capacitance:  $\geq 4.7$   $\mu$ F
- Dropout Voltage: 290 mV
- Built-In Current Limit and Thermal Shutdown Protection
- Package: High Thermal Performance HVSSOP PowerPAD™
- Operating Temperature Range:  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$

### 2 Applications

- Microprocessors, Microcontrollers Powered by Industrial Busses With High Voltage Transients
- Industrial Automation
- Telecom Infrastructure
- Automotive
- Power over Ethernet (PoE)
- LED Lighting
- Bias Power Supplies

### 3 Description

The TPS7A4001 device is a very high voltage-tolerant linear regulator that offers the benefits of a thermally-enhanced package (HVSSOP), and is able to withstand continuous DC or transient input voltages of up to 100 V.

The TPS7A4001 device is stable with any output capacitance greater than 4.7  $\mu$ F and any input capacitance greater than 1  $\mu$ F (over temperature and tolerance). Therefore, implementations of this device require minimal board space because of its miniaturized packaging (HVSSOP) and a potentially small output capacitor. In addition, the TPS7A4001 device offers an enable pin (EN) compatible with standard CMOS logic to enable a low-current shutdown mode.

The TPS7A4001 device has an internal thermal shutdown and current limiting to protect the system during fault conditions. The HVSSOP packages has an operating temperature range of  $T_J = -40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ .

In addition, the TPS7A4001 device is ideal for generating a low-voltage supply from intermediate voltage rails in telecom and industrial applications; not only can it supply a well-regulated voltage rail, but it can also withstand and maintain regulation during very high and fast voltage transients. These features translate to simpler and more cost-effective electrical surge-protection circuitry for a wide range of applications, including PoE, bias supply, and LED lighting.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS7A4001	HVSSOP (8)	3.00 mm x 5.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 5 Pin Configuration and Functions

### Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
OUT	1	O	Regulator output. A capacitor > 4.7 $\mu$ F must be tied from this pin to ground to assure stability.
FB	2	O	This pin is the input to the control-loop error amplifier. It is used to set the output voltage of the device.
NC	3	—	Not internally connected. This pin must either be left open or tied to GND.
	6		
	7		
GND	4	—	Ground
EN	5	I	This pin turns the regulator on or off. If $V_{EN} \geq V_{EN\_HI}$ the regulator is enabled. If $V_{EN} \leq V_{EN\_LO}$ , the regulator is disabled. If not used, the EN pin can be connected to IN. Make sure that $V_{EN} \leq V_{IN}$ at all times.
IN	8	I	Input supply
PowerPAD	—	—	Solder to printed-circuit-board (PCB) to enhance thermal performance. <b>NOTE: The PowerPAD is internally connected to GND.</b> Although it can be left floating, TI highly recommends connecting the PowerPAD to the GND plane.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

 over operating junction temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Voltage	IN pin to GND pin	–0.3	105	V
	OUT pin to GND pin	–0.3	105	
	OUT pin to IN pin	–105	0.3	
	FB pin to GND pin	–0.3	2	
	FB pin to IN pin	–105	0.3	
	EN pin to IN pin	–105	0.3	
	EN pin to GND pin	–0.3	105	
Current	Peak output	Internally limited		
Temperature	Operating virtual junction, T <sub>J</sub>	–40	125	°C
	Storage, T <sub>stg</sub>	–65	150	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge		V
	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2500	
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating junction temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V <sub>IN</sub>		7		100	V
V <sub>OUT</sub>		1.161		90	V
V <sub>EN</sub>		0		100	V
I <sub>OUT</sub>		0		50	mA

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS7A4001	UNIT
		DGN (HVVSOP)	
		8 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	66.7	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	54.1	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	38.1	°C/W
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	2	°C/W
Ψ <sub>JB</sub>	Junction-to-board characterization parameter	37.8	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	15.5	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](http://www.ti.com/lit/zip/Spra953).

## 6.5 Electrical Characteristics

At  $T_J = -40^\circ\text{C}$  to  $125^\circ\text{C}$ ,  $V_{IN} = V_{OUT(NOM)} + 2\text{ V}$  or  $V_{IN} = 7\text{ V}$  (whichever is greater),  $V_{EN} = V_{IN}$ ,  $I_{OUT} = 100\ \mu\text{A}$ ,  $C_{IN} = 1\ \mu\text{F}$ ,  $C_{OUT} = 4.7\ \mu\text{F}$ , and FB tied to OUT, unless otherwise noted.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{IN}$	Input voltage		7		100	V
$V_{REF}$	Internal reference	$T_J = 25^\circ\text{C}$ , $V_{FB} = V_{REF}$ , $V_{IN} = 9\text{ V}$ , $I_{OUT} = 25\text{ mA}$	1.161	1.173	1.185	V
$V_{OUT}$	Output voltage range <sup>(1)</sup>	$V_{IN} \geq V_{OUT(NOM)} + 2\text{ V}$	$V_{REF}$		90	V
	Nominal accuracy	$T_J = 25^\circ\text{C}$ , $V_{IN} = 9\text{ V}$ , $I_{OUT} = 25\text{ mA}$	-1		1	% $V_{OUT}$
	Overall accuracy	$V_{OUT(NOM)} + 2\text{ V} \leq V_{IN} \leq 24\text{ V}$ <sup>(2)</sup> $100\ \mu\text{A} \leq I_{OUT} \leq 50\text{ mA}$	-2.5		2.5	% $V_{OUT}$
$\frac{\Delta\%V_{OUT}}{\Delta V_{IN}}$	Line regulation	$7\text{ V} \leq V_{IN} \leq 100\text{ V}$		0.03		% $V_{OUT}$
$\frac{\Delta\%V_{OUT}}{\Delta I_{OUT}}$	Load regulation	$100\ \mu\text{A} \leq I_{OUT} \leq 50\text{ mA}$		0.31		% $V_{OUT}$
$V_{DO}$	Dropout voltage	$V_{IN} = 17\text{ V}$ , $V_{OUT(NOM)} = 18\text{ V}$ , $I_{OUT} = 20\text{ mA}$		290		mV
		$V_{IN} = 17\text{ V}$ , $V_{OUT(NOM)} = 18\text{ V}$ , $I_{OUT} = 50\text{ mA}$		0.78	1.3	V
$I_{LIM}$	Current limit	$V_{OUT} = 90\% V_{OUT(NOM)}$ , $V_{IN} = 7\text{ V}$ , $T_J \leq 85^\circ\text{C}$	51	117	200	mA
		$V_{OUT} = 90\% V_{OUT(NOM)}$ , $V_{IN} = 9\text{ V}$	51	128	200	mA
$I_{GND}$	Ground current	$7\text{ V} \leq V_{IN} \leq 100\text{ V}$ , $I_{OUT} = 0\text{ mA}$		25	65	$\mu\text{A}$
		$I_{OUT} = 50\text{ mA}$		25		$\mu\text{A}$
$I_{SHDN}$	Shutdown supply current	$V_{EN} = 0.4\text{ V}$		4.1	20	$\mu\text{A}$
$I_{FB}$	Feedback current <sup>(3)</sup>		-0.1	0.01	0.1	$\mu\text{A}$
$I_{EN}$	Enable current	$7\text{ V} \leq V_{IN} \leq 100\text{ V}$ , $V_{IN} = V_{EN}$		0.02	1	$\mu\text{A}$
$V_{EN\_HI}$	Enable high-level voltage		1.5		$V_{IN}$	V
$V_{EN\_LO}$	Enable low-level voltage		0		0.4	V
$V_{NOISE}$	Output noise voltage	$V_{IN} = 12\text{ V}$ , $V_{OUT(NOM)} = V_{REF}$ , $C_{OUT} = 10\ \mu\text{F}$ , $BW = 10\text{ Hz to }100\text{ kHz}$		58		$\mu\text{V}_{RMS}$
		$V_{IN} = 12\text{ V}$ , $V_{OUT(NOM)} = 5\text{ V}$ , $C_{OUT} = 10\ \mu\text{F}$ , $C_{BYP}$ <sup>(4)</sup> = $10\text{ nF}$ , $BW = 10\text{ Hz to }100\text{ kHz}$		73		$\mu\text{V}_{RMS}$
PSRR	Power-supply rejection ratio	$V_{IN} = 12\text{ V}$ , $V_{OUT(NOM)} = 5\text{ V}$ , $C_{OUT} = 10\ \mu\text{F}$ , $C_{BYP}$ <sup>(4)</sup> = $10\text{ nF}$ , $f = 100\text{ Hz}$		65		dB
$T_{SD}$	Thermal shutdown temperature	Shutdown, temperature increasing		170		$^\circ\text{C}$
		Reset, temperature decreasing		150		$^\circ\text{C}$
$T_J$	Operating junction temperature		-40		125	$^\circ\text{C}$

- (1) To ensure stability at no-load conditions, a current from the feedback resistive network greater than or equal to  $10\ \mu\text{A}$  is required.
- (2) Maximum input voltage is limited to  $24\text{ V}$  because of the package power dissipation limitations at full load ( $P \approx (V_{IN} - V_{OUT}) \times I_{OUT} = (24\text{ V} - V_{REF}) \times 50\text{ mA} \approx 1.14\text{ W}$ ). The device is capable of sourcing a maximum current of  $50\text{ mA}$  at higher input voltages as long as the power dissipated is within the thermal limits of the package plus any external heatsinking.
- (3)  $I_{FB} > 0$  flows out of the device.
- (4)  $C_{BYP}$  refers to a bypass capacitor connected to the FB and OUT pins.

### 6.6 Typical Characteristics

At  $T_J = -40^\circ\text{C}$  to  $125^\circ\text{C}$ ,  $V_{IN} = V_{OUT(NOM)} + 2\text{ V}$  or  $V_{IN} = 9\text{ V}$  (whichever is greater),  $V_{EN} = V_{IN}$ ,  $I_{OUT} = 100\ \mu\text{A}$ ,  $C_{IN} = 1\ \mu\text{F}$ ,  $C_{OUT} = 4.7\ \mu\text{F}$ , and FB tied to OUT, unless otherwise noted.

## 7 Detailed Description

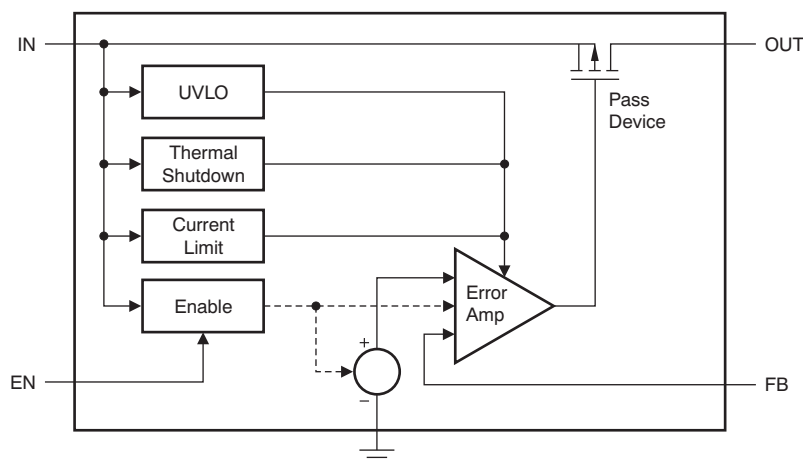

### 7.1 Overview

The TPS7A4001 device belongs to a new generation of linear regulators that use an innovative BiCMOS process technology to achieve very high maximum input and output voltages.

This process not only allows the TPS7A4001 device to maintain regulation during very fast high-voltage transients up to 105 V, but it also allows the TPS7A4001 device to regulate from a continuous high-voltage input rail. Unlike other regulators created using bipolar technology, the ground current of the TPS7A4001 device is also constant over its output current range, resulting in increased efficiency and lower power consumption.

These features, combined with a high thermal performance HVSSOP PowerPAD package, make this device ideal for industrial and telecom applications.

### 7.2 Functional Block Diagram

### 7.3 Feature Description

#### 7.3.1 Internal Current Limit

The fixed internal current limit of the TPS7A4001 device helps protect the regulator during fault conditions. The maximum amount of current the device can source is the current limit (309 mA, typical), and is largely independent of output voltage. For reliable operation, the device does not operate in current limit for extended periods of time.

#### 7.3.2 Enable Pin Operation

The TPS7A4001 device provides an enable pin (EN) feature that turns on the regulator when  $V_{EN} > V_{EN\_HI}$ , and disables the regulator when  $V_{EN} < V_{EN\_LO}$ .

#### 7.3.3 Thermal Protection

Thermal protection disables the output when the junction temperature rises to approximately 170°C, allowing the device to cool. When the junction temperature cools to approximately 150°C, the output circuitry is enabled. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This cycling limits the dissipation of the regulator, protecting it from damage as a result of overheating.

Any tendency to activate the thermal protection circuit indicates excessive power dissipation or an inadequate heatsink. For reliable operation, limit junction temperature to a maximum of 125°C. To estimate the margin of safety in a complete design (including heatsink), increase the ambient temperature until the thermal protection is triggered; use worst-case loads and signal conditions. For good reliability, trigger thermal protection at least 35°C above the maximum expected ambient condition of your particular application. This configuration produces a worst-case junction temperature of 125°C at the highest expected ambient temperature and worst-case load.

## Feature Description (continued)

The internal protection circuitry of the TPS7A4001 device has been designed to protect against overload conditions. The protection circuitry was not intended to replace proper heatsinking. Continuously running the TPS7A4001 device into thermal shutdown degrades device reliability.

### 7.3.4 Undervoltage Lockout (UVLO)

The TPS7A4001 contains an Undervoltage Lockout comparator that ensures the error amplifier is disabled when the input voltage is below the required minimum operational voltage. The minimum recommended operational voltage is 7 V.

## 7.4 Device Functional Modes

### 7.4.1 Normal Operation

The device regulates to the nominal output voltage under the following conditions:

- The input voltage is at least as high as  $V_{IN(min)}$ .
- The input voltage is greater than the nominal output voltage added to the dropout voltage.
- The enable voltage has previously exceeded the enable rising threshold voltage and has not decreased below the enable falling threshold.
- The output current is less than the current limit.
- The device junction temperature is less than the maximum specified junction temperature.

### 7.4.2 Dropout Operation

If the input voltage is lower than the nominal output voltage plus the specified dropout voltage, but all other conditions are met for normal operation, the device operates in dropout mode. In this mode of operation, the output voltage is the same as the input voltage minus the dropout voltage. The transient performance of the device is significantly degraded because the pass device (as a bipolar junction transistor, or BJT) is in saturation and no longer controls the current through the LDO. Line or load transients in dropout can result in large output voltage deviations.

### 7.4.3 Disabled

The device is disabled under the following conditions:

- The enable voltage is less than the enable falling threshold voltage or has not yet exceeded the enable rising threshold.
- The device junction temperature is greater than the thermal shutdown temperature.

[Table 1](#) lists the conditions that lead to the different modes of operation.

**Table 1. Device Functional Mode Comparison**

OPERATING MODE	PARAMETER			
	$V_{IN}$	$V_{EN}$	$I_{OUT}$	$T_J$
Normal mode	$V_{IN} > V_{OUT(nom)} + V_{DO}$ and $V_{IN} > V_{IN(min)}$	$V_{EN} > V_{EN\_HI}$	$I_{OUT} < I_{LIM}$	$T_J < 125^{\circ}C$
Dropout mode	$V_{IN(min)} < V_{IN} < V_{OUT(nom)} + V_{DO}$	$V_{EN} > V_{EN\_HI}$	—	$T_J < 125^{\circ}C$
Disabled mode (any true condition disables the device)	—	$V_{EN} < V_{EN\_LO}$	—	$T_J > 170^{\circ}C$

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

One of the primary applications of the TPS7A4001 device is to provide transient voltage protection to sensitive circuitry that may be damaged in the presence of high-voltage spikes.

This transient voltage protection can be more cost-effective and compact compared to topologies that use a transient voltage suppression (TVS) block.

#### 8.1.1 Adjustable Operation

The TPS7A4001 device has an output voltage range of about 1.175 to 90 V. The nominal output voltage of the device is set by two external resistors, as shown in [Figure 13](#).

**Figure 13. Adjustable Operation for Maximum AC Performance**

Calculate  $R_1$  and  $R_2$  for any output voltage range using the formula shown in [Equation 1](#). To ensure stability under no-load conditions, this resistive network must provide a current  $\geq 10 \mu\text{A}$ .

$$R_1 = R_2 \left( \frac{V_{\text{OUT}}}{V_{\text{REF}}} - 1 \right), \quad \text{where } \frac{V_{\text{OUT}}}{R_1 + R_2} \geq 10 \mu\text{A} \quad (1)$$

If greater voltage accuracy is required, consider the output voltage offset contributions because of the feedback pin current and use 0.1% tolerance resistors.

## 8.2 Typical Application

Figure 14. Example Circuit to Maximize Transient Performance

### 8.2.1 Design Requirements

For this design example, use the following parameters listed in Table 2.

Table 2. Design Parameters

PARAMETER	VALUE
V <sub>IN</sub>	12 V, with 55 V surge tolerance
V <sub>OUT</sub>	5 V (ideal), 4.981 (actual)
I <sub>OUT</sub>	28 mA
Accuracy	5 %
R1, R2	162 kΩ, 49.9 kΩ

### 8.2.2 Detailed Design Procedure

The maximum value of total feedback resistance can be calculated to be 500 kΩ. Equation 1 was used to calculate R1 and R2, and standard 1% resistors were selected to keep the accuracy within the 5% allocation. 10-µF ceramic input and output capacitors were selected, along with a 10-nF bypass capacitor for optimal AC performance.

#### 8.2.2.1 Capacitor Recommendations

Low equivalent series resistance (ESR) capacitors should be used for the input, output, and bypass capacitors. Ceramic capacitors with X7R and X5R dielectrics are required. Ceramic X7R capacitors offer improved voltage and temperature coefficients, while ceramic X5R capacitors are the most cost-effective and are available in higher values.

#### NOTE

High ESR capacitors may degrade PSRR.

#### 8.2.2.2 Input and Output Capacitor Requirements

The TPS7A4001 device high voltage linear regulator achieves stability with a minimum output capacitance of 4.7 µF and input capacitance of 1 µF; however, TI highly recommends to use 10-µF output and input capacitors to maximize AC performance.

#### 8.2.2.3 Bypass Capacitor Requirements

Although a bypass capacitor (C<sub>BYP</sub>) is not needed to achieve stability, TI highly recommends using a 10-nF bypass capacitor to maximize AC performance (including line transient, noise, and PSRR). For additional information regarding the performance improvements of using a bypass capacitor, see .

#### 8.2.2.4 Transient Response

As with any regulator, increasing the size of the output capacitor reduces overshoot and undershoot magnitude but increases the duration of the transient response.

The presence of the C<sub>BYP</sub> capacitor may greatly improve the line transient response of the TPS7A4001 device, as shown in Figure 1.

### 8.2.3 Application Curves

## 9 Power Supply Recommendations

The input supply for the LDO should not exceed its recommended operating conditions (7 V to 100 V). The input voltage should provide adequate headroom for the device to have a regulated output. If the input supply is noisy, additional input capacitors with low ESR can help improve the output noise performance. The input and output supplies should also be bypassed with 10- $\mu$ F capacitors located near the input and output pins. There should be no other components located between these capacitors and the pins.

## 10 Layout

### 10.1 Layout Guidelines

#### 10.1.1 Board Layout Recommendations to Improve PSRR and Noise Performance

To improve AC performance such as PSRR, output noise, and transient response, TI recommends designing the board with separate ground planes for IN and OUT, with each ground plane connected only at the GND pin of the device. In addition, the ground connection for the output capacitor should connect directly to the GND pin of the device.

Equivalent series inductance (ESL) and ESR must be minimized to maximize performance and ensure stability. Every capacitor ( $C_{IN}$ ,  $C_{OUT}$ ,  $C_{BYP}$ ) must be placed as close as possible to the device and on the same side of the PCB as the regulator itself.

Do not place any of the capacitors on the opposite side of the PCB from where the regulator is installed. The use of vias and long traces is strongly discouraged because they may impact system performance negatively and even cause instability.

If possible, and to ensure the maximum performance denoted in this product data sheet, use the same layout pattern used for the TPS7A40 evaluation board, available at [www.ti.com](http://www.ti.com).

### 10.2 Layout Example

Figure 17. Recommended Layout Example

### 10.3 Thermal Considerations

Thermal protection disables the output when the junction temperature rises to approximately 170°C, allowing the device to cool. When the junction temperature cools to approximately 150°C, the output circuitry is enabled. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle ON and OFF. This cycling limits the dissipation of the regulator, protecting it from damage as a result of overheating.

## Thermal Considerations (continued)

Any tendency to activate the thermal protection circuit indicates excessive power dissipation or an inadequate heatsink. For reliable operation, junction temperature should be limited to a maximum of 125°C. To estimate the margin of safety in a complete design (including heatsink), increase the ambient temperature until the thermal protection is triggered; use worst-case loads and signal conditions. For good reliability, thermal protection should trigger at least 45°C above the maximum expected ambient condition of the particular application. This configuration produces a worst-case junction temperature of 125°C at the highest expected ambient temperature and worst-case load.

The internal protection circuitry of the TPS7A4001 has been designed to protect against overload conditions. It was not intended to replace proper heatsinking. Continuously running the TPS7A4001 device into thermal shutdown degrades device reliability.

### 10.4 Power Dissipation

The ability to remove heat from the die is different for each package type, presenting different considerations in the PCB layout. The PCB area around the device that is free of other components moves the heat from the device to the ambient air. Using heavier copper increases the effectiveness in removing heat from the device. The addition of plated through-holes to heat dissipating layers also improves the heatsink effectiveness.

Power dissipation depends on input voltage and load conditions. Power dissipation ( $P_D$ ) is equal to the product of the output current times the voltage drop across the output pass element, as shown in [Equation 2](#):

$$P_D = (V_{IN} - V_{OUT}) I_{OUT} \quad (2)$$

## 11 Device and Documentation Support

All other trademarks are the property of their respective owners.

### 11.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 11.4 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS7A4001DGNR	ACTIVE	MSOP- PowerPAD	DGN	8	2500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 125	QVQ	<a href="#">Samples</a>
TPS7A4001DGNT	ACTIVE	MSOP- PowerPAD	DGN	8	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 125	QVQ	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

### QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
TPS7A4001DGNR	MSOP-Power PAD	DGN	8	2500	330.0	12.4	5.3	3.3	1.3	8.0	12.0	Q1
TPS7A4001DGNT	MSOP-Power PAD	DGN	8	250	180.0	12.4	5.3	3.3	1.3	8.0	12.0	Q1

**TAPE AND REEL BOX DIMENSIONS**

\*All dimensions are nominal

PowerPAD™ PLASTIC SMALL OUTLINE

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Body dimensions do not include mold flash or protrusion.
  - This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
  - Falls within JEDEC MO-187 variation AA-T

PowerPAD is a trademark of Texas Instruments.

DGN (S-PDSO-G8)

PowerPAD™ PLASTIC SMALL OUTLINE

## THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions

4206323-3/1 12/11

NOTE: All linear dimensions are in millimeters

PowerPAD is a trademark of Texas Instruments

4207737-3/F 02/13

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
  - This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
  - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

PowerPAD is a trademark of Texas Instruments

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
