

符合 Qi (WPC v1.2) 标准的 bq51003 高度集成无线接收器电源

1 特性

- 集成型无线电源接收器解决方案（针对 2.5W 应用进行了优化）
 - 93% 的整体峰值交流 (AC) -- 直流 (DC) 转换效率
 - 完全同步整流器
 - 符合 WPC v1.2 标准的通信控制
 - 输出电压调节
 - 在 RX 线圈与输出之间只需要集成电路 (IC)
- 符合无线电源联盟 (WPC) v1.2 标准（启用 FOD）的高精度电流传感
- 动态整流器控制，可改进负载瞬态响应
- 可在宽泛的输出电源范围内优化性能的动态效率调节
- 针对稳健通信的自适应通信限制
- 支持 20V 最高输入电压
- 低功率耗散整流器过压钳位 ($V_{RECT-OVP} = 15V$)
- 热关断
- 用于温度监控、充电完成和故障主机控制的多功能负温度系数热敏电阻 (NTC) 和控制引脚

2 应用

- 符合 WPC 标准的接收器
- 手机和智能电话
- 耳机
- 数码摄像机
- 便携式媒体播放器
- 手持式设备

3 说明

bq51003 是一款用于在便携式应用中进行无线电源传输的高级集成型接收器 IC，针对功率为 2.5W 及其以下的应用进行了优化。该器件可提供交流/直流电源转换，同时集成了使用 Qi v1.2 通信协议所需的数字控制功能。通过与 bq500210 发送器控制器相结合，bq51003 可为一个无线电源解决方案提供一个完整的非接触式电力传输系统。通过使用近场感应式电力传输，嵌入在便携式设备中的接收器线圈可通过相互耦合的电感器接受发送器线圈发出的电能。然后，来自接收器线圈的交流信号经过整流和调节可用作系统关闭电子产品的电源。为了稳定电力传输过程，建立了从次级侧到发送器的全局反馈机制（通过反向散射调制）。此反馈是通过使用支持高达 2.5W 应用的 Qi v1.2 通信协议建立的。

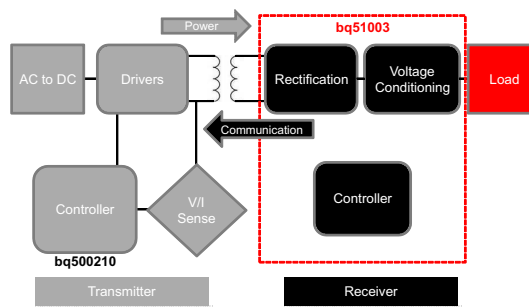

该器件集成了低阻抗完全同步整流器、低压降稳压器、数字控制以及精确电压和电流环路。

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
AC1	B3, B4	I	AC input from receiver coil antenna.
AC2	B1, B2	I	
AD	G4	I	Connect this pin to the wired adapter input. When a voltage is applied to this pin wireless charging is disabled and AD_EN is driven low. Connect to GND through a 1 μ F capacitor. If unused, capacitor is not required and should be grounded directly.
$\overline{\text{AD-EN}}$	F3	O	Push-pull driver for external PFET connecting AD and OUT. This node is pulled to the higher of OUT and AD when turning off the external FET. This voltage tracks approximately 4 V below AD when voltage is present at AD and provides a regulated V_{GS} bias for the external FET. Float this pin if unused.
BOOT1	C4	O	Bootstrap capacitors for driving the high-side FETs of the synchronous rectifier. Connect a 10 nF ceramic capacitor from BOOT1 to AC1 and from BOOT2 to AC2.
BOOT2	C1	O	
$\overline{\text{CHG}}$	F4	O	Open-drain output – Active when the output of the wireless power supply is enabled.
CLAMP1	E3	O	
CLAMP2	E2	O	Open drain FETs which are utilized for a non-power dissipative over-voltage AC clamp protection. When the RECT voltage goes above 15 V, both switches will be turned on and the capacitors will act as a low impedance to protect the IC from damage. If used, CLAMP1 is required to be connected to AC1, and CLAMP2 is required to be connected to AC2 through 0.47- μ F capacitors.
COMM1	E4	O	Open-drain output used to communicate with primary by varying reflected impedance. Connect COMM1 through a capacitor to either AC1 or AC2 for capacitive load modulation (COMM2 must be connected to the alternate AC1 or AC2 pin). For resistive modulation connect COMM1 and COMM2 to RECT through a single resistor; connect through separate capacitors for capacitive load modulation.
COMM2	E1	O	
EN1	G3	I	Inputs that allow user to enable/disable wireless and wired charging <EN1 EN2>: <00> Wireless charging is enabled <01> Dynamic communication current limit disabled <10> Wireless charging disabled <11> Wireless charging disabled.
EN2	G2	I	
FOD	F2	I	Input for the received power measurement. Connect to GND with a R_{FOD} resistor.
ILIM	G1	I/O	Programming pin for the over current limit. Connect external resistor to VSS. Size R_{ILIM} with the following equation: $R_{ILIM} = 262 / I_{MAX}$ where I_{MAX} is the expected maximum output current of the wireless power supply. The hardware current limit (I_{ILIM}) will be 20% greater than I_{MAX} or $1.2 \times I_{MAX}$. If the supply is meant to operate in current limit use $R_{ILIM} = 314 / I_{ILIM}$ $R_{ILIM} = R1 + R_{FOD}$
OUT	D1, D2, D3, D4	O	Output pin, delivers power to the load.
PGND	A1, A2, A3, A4		Power ground
RECT	C2, C3	O	Filter capacitor for the internal synchronous rectifier. Connect a ceramic capacitor to PGND. Depending on the power levels, the value may be 4.7 μ F to 22 μ F.
TS-CTRL	F1	I	Must be connected to ground through a resistor. If an NTC function is not desired connect to GND with a 10-k Ω resistor. As a CTRL pin pull to ground to send end power transfer (EPT) fault to the transmitter or pullup to an internal rail (i.e. 1.8 V) to send EPT termination to the transmitter. Note that a 3-state driver should be used to interface this pin (see 3-State Driver Recommendations for the TS-CTRL Pin for further description).

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾

		MIN	MAX	UNIT
Input voltage	AC1, AC2	-0.8	20	V
	RECT, COMM1, COMM2, OUT, $\overline{\text{CHG}}$, CLAMP1, CLAMP2	-0.3	20	
	AD, $\overline{\text{AD-EN}}$	-0.3	30	
	BOOT1, BOOT2	-0.3	26	
	EN1, EN2, FOD, TS-CTRL, ILIM	-0.3	7	
Input current	AC1, AC2		1	A(RMS)
Output current	OUT		525	mA
Output sink current	$\overline{\text{CHG}}$		15	mA
	COMM1, COMM2		1	A
Junction temperature, T_J		-40	150	°C
Storage temperature, T_{stg}		-65	150	°C

- (1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages are with respect to the VSS terminal, unless otherwise noted.

7.2 ESD Ratings

		VALUE	UNIT
$V_{\text{(ESD)}}$ Electrostatic discharge ⁽¹⁾	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽²⁾	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽³⁾	±500	

- (1) 100 pF, 1.5 k Ω
- (2) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (3) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	MAX	UNIT
V_{IN}	Input voltage	RECT	4	10	V
I_{IN}	Input current	RECT		500	mA
I_{OUT}	Output current	OUT		500	mA
$I_{\text{AD-EN}}$	Sink current	$\overline{\text{AD-EN}}$		1	mA
I_{COMM}	COMM sink current	COMM		500	mA
T_J	Junction temperature		0	125	°C

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		bq51003	
		YFP (DSBGA)	
		28 PINS	
			UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	58.9	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	0.2	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	9.1	°C/W
ψ_{JT}	Junction-to-top characterization parameter	1.4	°C/W
ψ_{JB}	Junction-to-board characterization parameter	8.9	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	—	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.5 Electrical Characteristics

over operating free-air temperature range, 0°C to 125°C (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
UVLO	Undervoltage lockout	$V_{RECT}: 0\text{ V} \rightarrow 3\text{ V}$	2.6	2.7	2.8	V
V_{HYS}	Hysteresis on UVLO	$V_{RECT}: 3\text{ V} \rightarrow 2\text{ V}$		250		mV
	Hysteresis on OVP	$V_{RECT}: 16\text{ V} \rightarrow 5\text{ V}$		150		mV
$V_{RECT-OVP}$	Input overvoltage threshold	$V_{RECT}: 5\text{ V} \rightarrow 16\text{ V}$	14.5	15	15.5	V
$V_{RECT-REG}$	Dynamic V_{RECT} threshold 1	$I_{LOAD} < 0.1 \times I_{IMAX}$ (I_{LOAD} rising)		7.08		V
	Dynamic V_{RECT} threshold 2	$0.1 \times I_{IMAX} < I_{LOAD} < 0.2 \times I_{IMAX}$ (I_{LOAD} rising)		6.28		
	Dynamic V_{RECT} threshold 3	$0.2 \times I_{IMAX} < I_{LOAD} < 0.4 \times I_{IMAX}$ (I_{LOAD} rising)		5.53		
	Dynamic V_{RECT} threshold 4	$I_{LOAD} > 0.4 \times I_{IMAX}$ (I_{LOAD} rising)		5.11		
		V_{RECT} TRACKING	In current limit voltage above V_{OUT}		$V_O+0.25$	
I_{LOAD}	I_{LOAD} hysteresis for dynamic V_{RECT} thresholds as a % of I_{LIM}	I_{LOAD} falling		4%		
$V_{RECT-DPM}$	Rectifier undervoltage protection, restricts I_{OUT} at $V_{RECT-DPM}$		3	3.1	3.2	V
$V_{RECT-REV}$	Rectifier reverse voltage protection at the output	$V_{RECT-REV} = V_{OUT} - V_{RECT}$, $V_{OUT} = 10\text{ V}$		8	9	V
QUIESCENT CURRENT						
I_{RECT}	Active chip quiescent current consumption from RECT	$I_{LOAD} = 0\text{ mA}$, $0^\circ\text{C} \leq T_J \leq 85^\circ\text{C}$		8	10	mA
		$I_{LOAD} = 300\text{ mA}$, $0^\circ\text{C} \leq T_J \leq 85^\circ\text{C}$		2	3	mA
I_{OUT}	Quiescent current at the output when wireless power is disabled (Standby)	$V_{OUT} = 5\text{ V}$, $0^\circ\text{C} \leq T_J \leq 85^\circ\text{C}$		20	35	μA
I_{LIM} SHORT CIRCUIT						
R_{LIM}	Highest value of I_{LIM} resistor considered a fault (short). Monitored for $I_{OUT} > 100\text{ mA}$	$R_{LIM}: 200\ \Omega \rightarrow 50\ \Omega$. I_{OUT} latches off, cycle power to reset			120	Ω
t_{DGL}	Deglintch time transition from I_{LIM} short to I_{OUT} disable			1		ms
I_{LIM_SC}	$I_{LIM_SHORT,OK}$ enables the I_{LIM} short comparator when I_{OUT} is greater than this value	$I_{LOAD}: 0\text{ mA} \rightarrow 200\text{ mA}$	120	145	165	mA
	Hysteresis for $I_{LIM_SHORT,OK}$ comparator	$I_{LOAD}: 0\text{ mA} \rightarrow 200\text{ mA}$		30		mA
I_{OUT}	Maximum output current limit, C_L	Maximum I_{LOAD} that will be delivered for 1 ms when I_{LIM} is shorted			2.45	A

Electrical Characteristics (continued)

over operating free-air temperature range, 0°C to 125°C (unless otherwise noted)

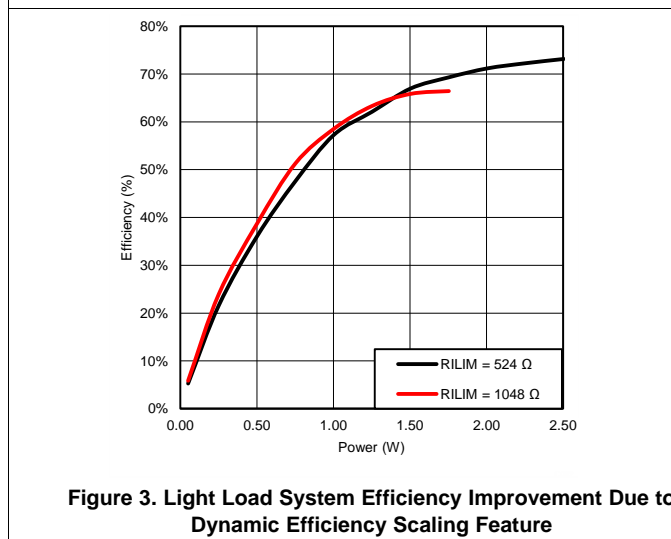

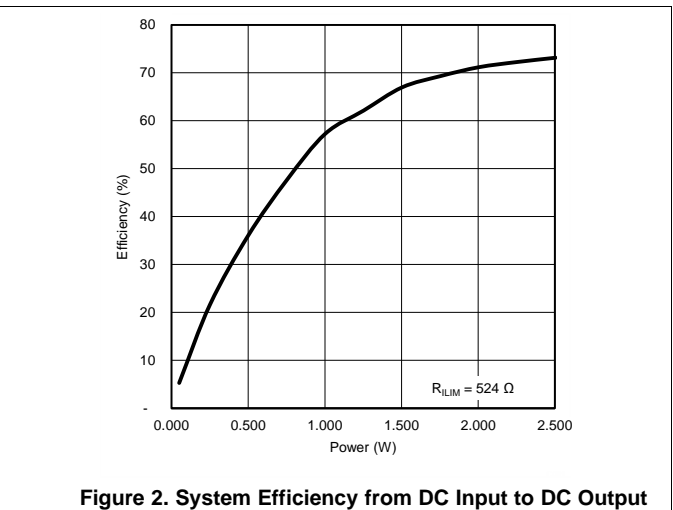

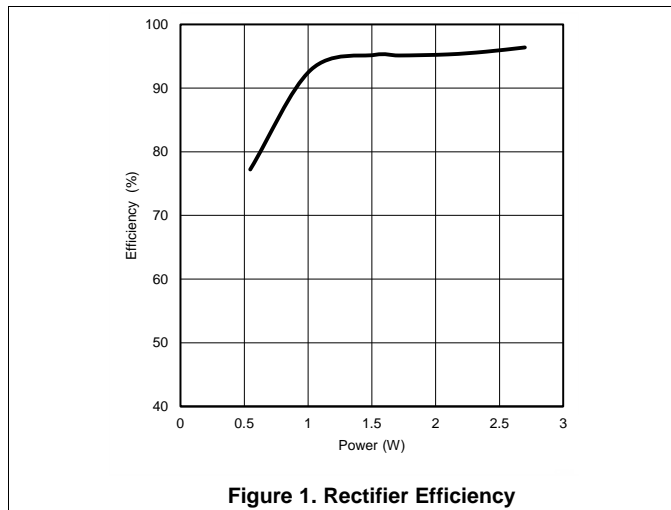

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
OUTPUT

8 Detailed Description

8.1 Overview

The principle of wireless power transfer is simply an open-cored transformer consisting of transmitter and receiver coils. The transmitter coil and electronics are typically built into a charger pad, and the receiver coil and electronics are typically built into a portable device such as a cell phone. When the receiver coil is positioned on the transmitter coil, magnetic coupling occurs when the transmitter coil is driven. The flux is coupled into the secondary coil, which induces a voltage and current flows. The secondary voltage is rectified, and power can be transferred effectively to a load wirelessly. Power transfer can be managed through any of the various closed-loop control schemes.

8.1.1 A Brief Description of the Wireless System

A wireless system consists of a charging pad (transmitter or primary) and the secondary-side equipment (receiver or secondary). There is a coil in the charging pad and in the secondary equipment which are magnetically coupled to each other when the secondary is placed on the primary. Power is then transferred from the transmitter to the receiver through coupled inductors (for example, an air-core transformer). Controlling the amount of power transferred is achieved by sending feedback (error signal) communication to the primary (that is, to increase or decrease power).

The receiver communicates with the transmitter by changing the load seen by the transmitter. This load variation results in a change in the transmitter coil current, which is measured and interpreted by a processor in the charging pad. Communication is done through digital-packets which are transferred from the receiver to the transmitter. Differential Biphase encoding is used for the packets. The bit rate is 2-kbps.

Various types of communication packets have been defined. These include identification and authentication packets, error packets, control packets, end power packets, and power usage packets.

The transmitter coil stays powered off most of the time. It occasionally wakes up to see if a receiver is present. When a receiver authenticates itself to the transmitter, the transmitter will remain powered on. The receiver maintains full control over the power transfer using communication packets.

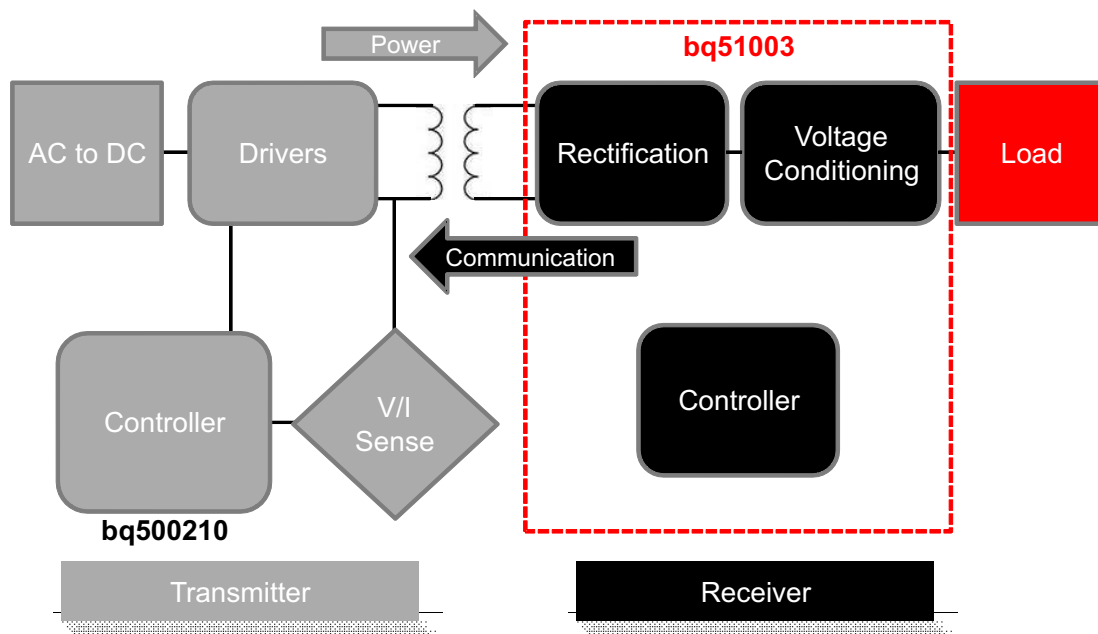

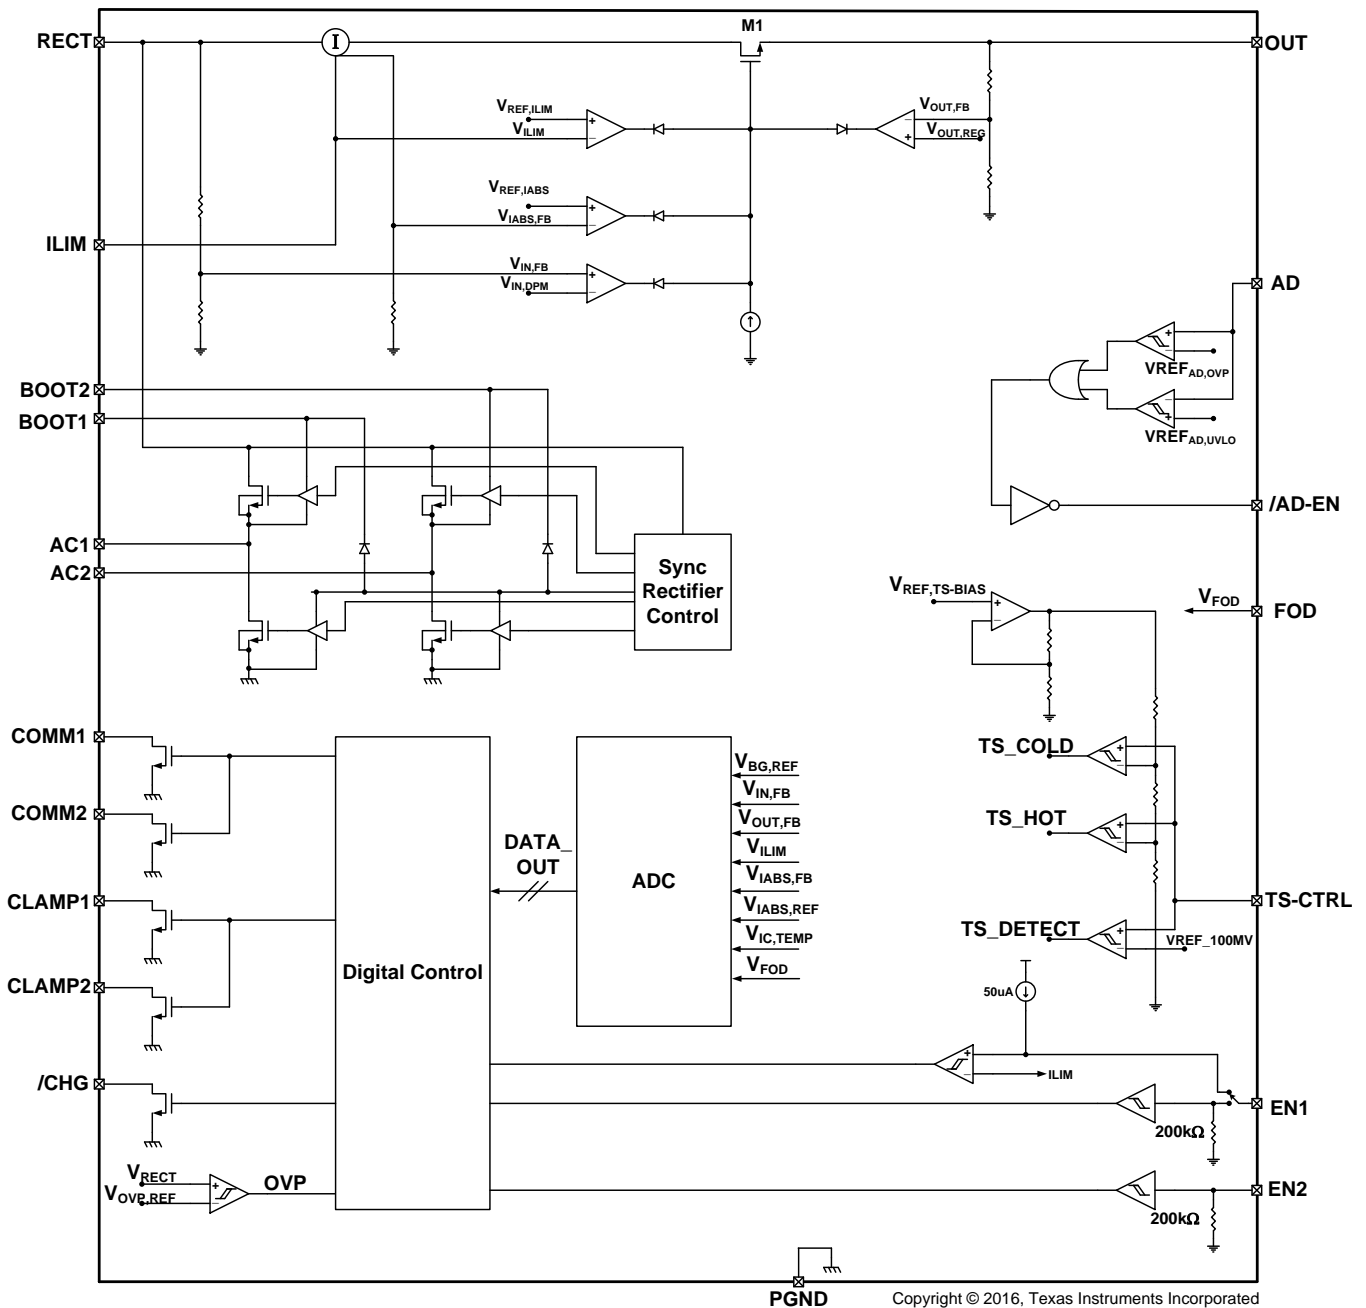

Figure 17. WPC Wireless Power System Indicating the Functional Integration of the bq51003

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Details of a Qi Wireless Power System and bq51003 Power Transfer Flow Diagrams

The bq51003 integrates a fully compliant WPC v1.2 communication algorithm to streamline receiver designs (no extra software development required). Other unique algorithms such as Dynamic Rectifier Control are also integrated to provide best-in-class system performance. This section provides a high-level overview of these features by illustrating the wireless power transfer flow diagram from start-up to active operation.

Feature Description (continued)

During start-up operation, the wireless power receiver must comply with proper handshaking to be granted a power contract from the Tx. The Tx initiates the hand shake by providing an extended digital ping. If an Rx is present on the Tx surface, the Rx then provides the signal strength, configuration, and identification packets to the Tx (see volume 1 of the WPC specification for details on each packet). These are the first three packets sent to the Tx. The only exception is if there is a true shutdown condition on the EN1/EN2, AD, or TS-CTRL pins where the Rx will shut down the Tx immediately. See Table 5 for details. Once the Tx has successfully received the signal strength, configuration, and identification packets, the Rx will be granted a power contract and is then allowed to control the operating point of the power transfer. With the use of the bq51003 Dynamic Rectifier Control algorithm, the Rx will inform the Tx to adjust the rectifier voltage above 7 V prior to enabling the output supply. This method enhances the transient performance during system start-up. See Figure 18 for the start-up flow diagram details.

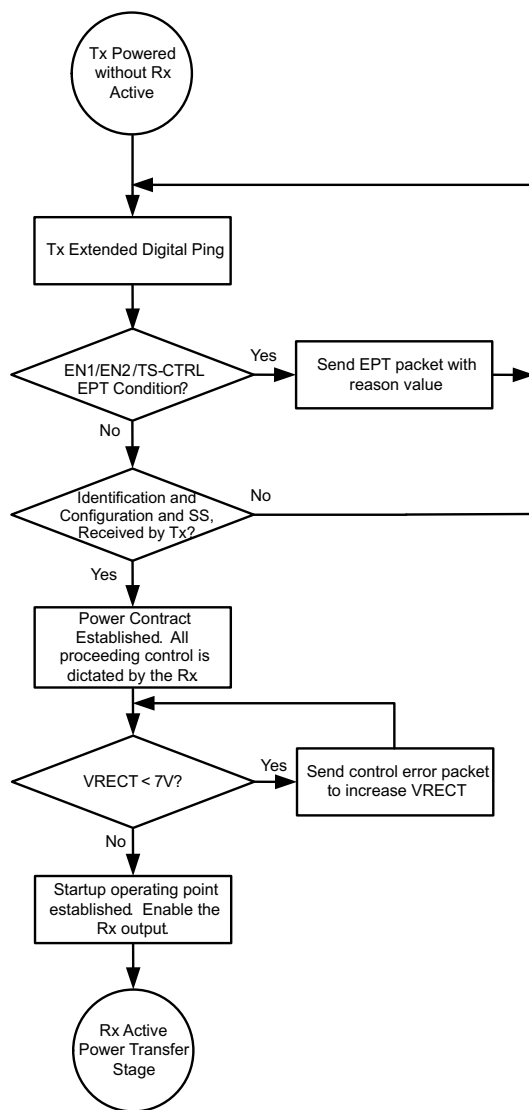

Figure 18. Wireless Power Start-Up Flow Diagram

Feature Description (continued)

Once the start-up procedure has been established, the Rx will enter the active power transfer stage. This is considered the *main loop* of operation. The Dynamic Rectifier Control algorithm will determine the rectifier voltage target based on a percentage of the maximum output current level setting (set by K_{IMAX} and the $ILIM$ resistance to GND). The Rx will send control error packets to converge on these targets. As the output current changes, the rectifier voltage target will dynamically change. As a note, the feedback loop of the WPC system is relatively slow where it can take up to 90 ms to converge on a new rectifier voltage target. It should be understood that the instantaneous transient response of the system is open loop and dependent on the Rx coil output impedance at that operating point. The *main loop* will also determine if any conditions in [Table 5](#) are true to discontinue power transfer. See [Figure 19](#) which illustrates the active power transfer loop.

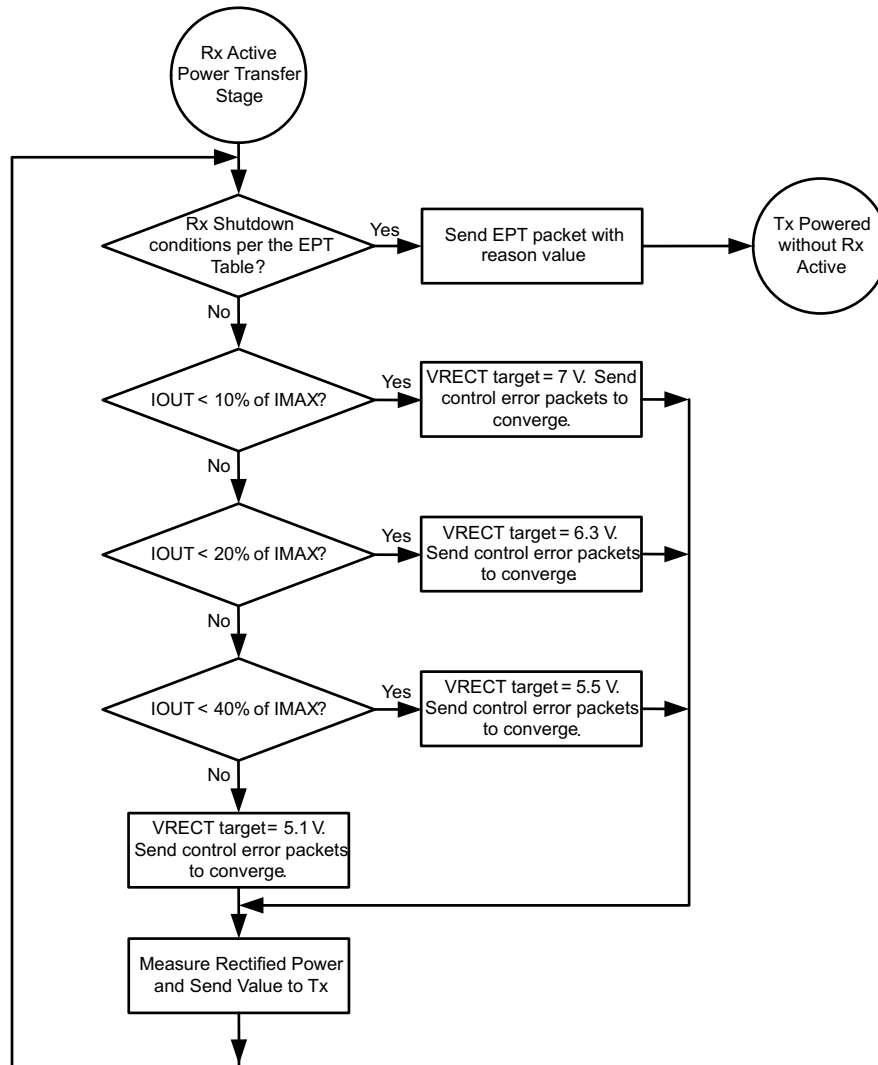

Figure 19. Active Power Transfer Flow Diagram

Another requirement of the WPC v1.2 specification is to send the measured received power. This task is enabled on the IC by measuring the voltage on the FOD pin which is proportional to the output current and can be scaled based on the choice of the resistor to ground on the FOD pin.

Feature Description (continued)

8.3.2 Dynamic Rectifier Control

The Dynamic Rectifier Control algorithm offers the end system designer optimal transient response for a given max output current setting. This is achieved by providing enough voltage headroom across the internal regulator at light loads to maintain regulation during a load transient. The WPC system has a relatively slow global feedback loop where it can take more than 90 ms to converge on a new rectifier voltage target. Therefore, the transient response is dependent on the loosely coupled transformers output impedance profile. The Dynamic Rectifier Control allows for a 2-V change in rectified voltage before the transient response will be observed at the output of the internal regulator (output of the bq51003).

8.3.3 Dynamic Efficiency Scaling

The Dynamic Efficiency Scaling feature allows for the loss characteristics of the bq51003 to be scaled based on the maximum expected output power in the end application. This effectively optimizes the efficiency for each application. This feature is achieved by scaling the loss of the internal LDO based on a percentage of the maximum output current. Note that the maximum output current is set by the $K_{I_{MAX}}$ term and the R_{ILIM} resistance (where $R_{ILIM} = K_{I_{MAX}} / I_{MAX}$). The flow diagram show in [Figure 19](#) illustrates how the rectifier is dynamically controlled (*Dynamic Rectifier Control*) based on a fixed percentage of the I_{MAX} setting. [Table 2](#) summarizes how the rectifier behavior is dynamically adjusted based on two different R_{ILIM} settings.

Table 2. Dynamic Efficiency Scaling

OUTPUT CURRENT PERCENTAGE	$R_{ILIM} = 1116 \Omega$ $I_{MAX} = 250 \text{ mA}$	$R_{ILIM} = 488 \Omega$ $I_{MAX} = 500 \text{ mA}$	V_{RECT}
0 to 10%	0 A to 0.025 A	0 A to 0.05 A	7.08 V
10 to 20%	0.025 A to 0.050 A	0.050 A to 0.100 A	6.28 V
20 to 40%	0.050 A to 0.100 A	0.100 A to 0.200 A	5.53 V
>40%	> 0.100 A	> 0.200 A	5.11 V

[Figure 5](#) illustrates the shift in the *Dynamic Rectifier Control* behavior based on the two different R_{ILIM} settings. With the rectifier voltage (V_{RECT}) being the input to the internal LDO, this adjustment in the *Dynamic Rectifier Control* thresholds will dynamically adjust the power dissipation across the LDO where:

$$P_{DIS} = (V_{RECT} - V_{OUT}) \times I_{OUT} \quad (1)$$

[Figure 3](#) illustrates how the system efficiency is improved due to the *Dynamic Efficiency Scaling* feature. Note that this feature balances efficiency with optimal system transient response.

8.3.4 R_{ILIM} Calculations

The bq51003 includes a means of providing hardware overcurrent protection by means of an analog current regulation loop. The hardware current limit provides an extra level of safety by clamping the maximum allowable output current (that is, a current compliance). The R_{ILIM} resistor size also sets the thresholds for the dynamic rectifier levels and thus providing efficiency tuning per each application's maximum system current. The calculation for the total R_{ILIM} resistance is as follows:

$$R_{ILIM} = \frac{262}{I_{MAX}}$$

$$I_{ILIM} = 1.2 \times I_{MAX} = \frac{314}{R_{ILIM}}$$

$$R_{ILIM} = R_1 + R_{FOD}$$

where

- I_{MAX} is the expected maximum output current during normal operation
 - I_{ILIM} is the hardware over current limit
- (2)

When referring to the application diagram shown in [Figure 32](#), R_{ILIM} is the sum of R_{FOD} and the R_1 resistance (that is, the total resistance from the ILIM pin to GND).

8.3.5 Input Overvoltage

If the input voltage suddenly increases in potential (that is, due to a change in position of the equipment on the charging pad), the voltage-control loop inside the bq51003 becomes active, and prevents the output from going beyond $V_{OUT-REG}$. The receiver then starts sending back error packets to the transmitter every 30 ms until the input voltage comes back to the $V_{RECT-REG}$ target, and then maintains the error communication every 250 ms.

If the input voltage increases in potential beyond $V_{RECT-OVP}$, the IC switches off the LDO and communicates to the primary to bring the voltage back to $V_{RECT-REG}$. In addition, a proprietary voltage protection circuit is activated by means of C_{CLAMP1} and C_{CLAMP2} that protects the IC from voltages beyond the maximum rating of the IC (that is, 20 V).

8.3.6 Adapter Enable Functionality and EN1/EN2 Control

Figure 38 is an example application that shows the bq51003 used as a wireless power receiver that can power multiplex between wired or wireless power for the down-system electronics. In the default operating mode pins EN1 and EN2 are low, which activates the adapter enable functionality. In this mode, if an adapter is not present the AD pin will be low, and AD-EN pin will be pulled to the higher of the OUT and AD pins so that the PMOS between OUT and AD will be turned off. If an adapter is plugged in and the voltage at the AD pin goes above 3.6 V then wireless charging is disabled and the AD-EN pin will be pulled approximately 4 V below the AD pin to connect AD to the secondary charger. The difference between AD and AD-EN is regulated to a maximum of 7 V to ensure the V_{GS} of the external PMOS is protected.

The EN1 and EN2 pins include internal 200-k Ω pulldown resistors, so that if these pins are not connected bq51003 defaults to AD-EN control mode. However, these pins can be pulled high to enable other operating modes as described in Table 3:

Table 3. Adapter Enable Functionality

EN1	EN2	RESULT
0	0	Adapter control enabled. If adapter is present then secondary charger is powered by adapter, otherwise wireless charging is enabled when wireless power is available. Communication current limit is enabled.
0	1	Disables communication current limit.
1	0	AD-EN is pulled low, whether or not adapter voltage is present. This feature can be used, for example, for USB OTG applications.
1	1	Adapter and wireless charging are disabled, that is, power will never be delivered by the OUT pin in this mode.

Table 4. EN1/EN2 Control

EN1	EN2	WIRELESS POWER	WIRED POWER	OTG MODE	ADAPTIVE COMMUNICATION LIMIT	EPT
0	0	Enabled	Priority ⁽¹⁾	Disabled	Enabled	Not Sent to Tx
0	1	Priority ⁽¹⁾	Enabled	Disabled	Disabled	Not Sent to Tx
1	0	Disabled	Enabled	Enabled ⁽²⁾	N/A	No Response
1	1	Disabled	Disabled	Disabled	N/A	Termination

(1) If both wired and wireless power are present, wired power is given priority.

(2) Allows for a boost-back supply to be driven from the output terminal of the Rx to the adapter port through the external back-to-back PMOS FET.

As described in Table 4, pulling EN2 high disables the adapter mode and only allows wireless charging. In this mode the adapter voltage will always be blocked from the OUT pin. An application example where this mode is useful is when USB power is present at AD, but the USB is in suspend mode so that no power can be taken from the USB supply. Pulling EN1 high enables the off-chip PMOS regardless of the presence of a voltage. This function can be used in USB OTG mode to allow a charger connected to the OUT pin to power the AD pin. Finally, pulling both EN1 and EN2 high disables both wired and wireless charging.

NOTE

It is required to connect a back-to-back PMOS between AD and OUT so that voltage is blocked in both directions. Also, when AD mode is enabled no load can be pulled from the RECT pin as this could cause an internal device overvoltage in bq51003.

8.3.7 End Power Transfer Packet (WPC Header 0x02)

The WPC allows for a special command for the receiver to terminate power transfer from the transmitter termed End Power Transfer (EPT) packet. Table 5 specifies the v1.2 reasons column and their corresponding data field value. The condition column corresponds to the methodology used by bq51003 to send equivalent message.

Table 5. End Power Transfer Packet

MESSAGE	VALUE	CONDITION
Charge Complete	0x01	TS-CTRL = 1, or EN1 = 1, or <EN1 EN2> = <11>
Internal Fault	0x02	$T_J > 150^{\circ}\text{C}$ or $R_{LIM} < 100 \Omega$
Over Temperature	0x03	$TS < V_{HOT}$, $TS > V_{COLD}$, or $TS-CTRL < 100 \text{ mV}$
Over Voltage	0x04	Not Sent
Over Current	0x05	NOT USED
Battery Failure	0x06	Not Sent
Reconfigure	0x07	Not Sent
No Response	0x08	V_{RECT} target does not converge

8.3.8 Status Outputs

The bq51003 has one status output, $\overline{\text{CHG}}$. This output is an open-drain NMOS device that is rated to 20 V. The open-drain FET connected to the $\overline{\text{CHG}}$ pin will be turned on whenever the output of the power supply is enabled. Note that the output of the power supply will not be enabled if the $V_{RECT-REG}$ does not converge at the no-load target voltage.

8.3.9 WPC Communication Scheme

The WPC communication uses a modulation technique termed *backscatter modulation* where the receiver coil is dynamically loaded to provide amplitude modulation of the transmitter's coil voltage and current. This scheme is possible due to the fundamental behavior between two loosely coupled inductors (that is, between the Tx and Rx coil). This type of modulation can be accomplished by switching in and out a resistor at the output of the rectifier, or by switching in and out a capacitor across the AC1/AC2 net. Figure 20 shows how to implement resistive modulation.

Figure 20. Resistive Modulation

Figure 21 shows how to implement capacitive modulation.

Figure 21. Capacitive Modulation

The amplitude change in Tx coil voltage or current can be detected by the transmitters decoder. Figure 22 shows the resulting signal observed by the Tx.

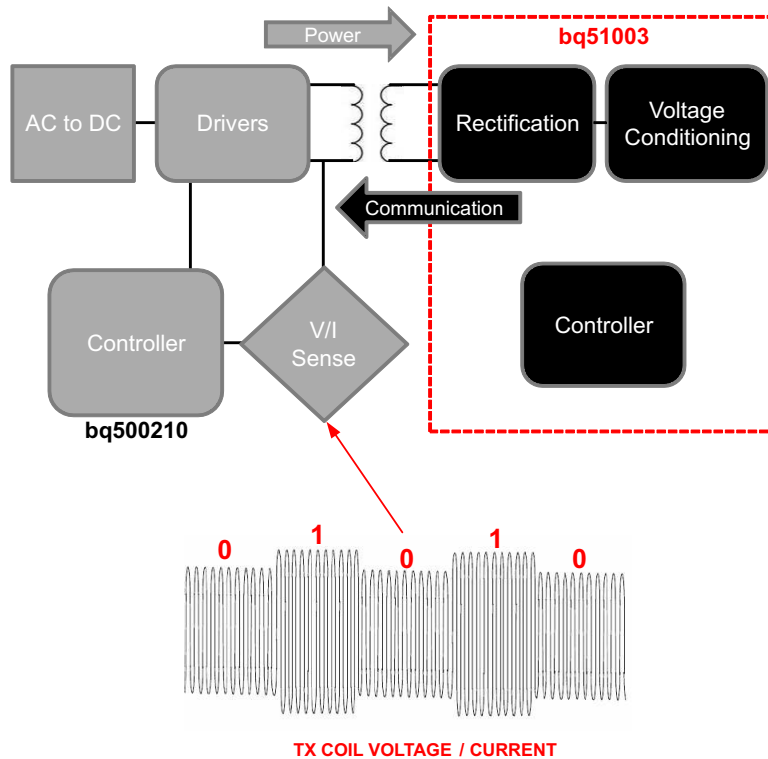

Figure 22. TX Coil Voltage and Current

The WPC protocol uses a differential biphas encoding scheme to modulate the data bits onto the Tx coil voltage and current. Each data bit is aligned at a full period of 0.5 ms (t_{CLK}) or 2 kHz. An encoded ONE results in two transitions during the bit period and an encoded ZERO results in a single transition. See Figure 23 for an example of the differential biphas encoding.

Figure 23. Differential Biphas Encoding Scheme (WPC Volume 1: Low Power, Part 1 Interface Definition)

The bits are sent LSB first and use an 11-bit asynchronous serial format for each portion of the packet. This includes one start bit, n-data bytes, a parity bit, and a single stop bit. The start bit is always ZERO and the parity bit is odd. The stop bit is always ONE. Figure 24 shows the details of the asynchronous serial format.

Figure 24. Asynchronous Serial Formatting (WPC volume 1: Low Power, Part 1 Interface Definition)

Each packet format is organized as shown in Figure 25.

Figure 25. Packet Format (WPC Volume 1: Low Power, Part 1 Interface Definition)

Figure 16 shows an example waveform of the receiver sending a rectified power packet (header 0x04).

8.3.10 Communication Modulator

The bq51003 provides two identical, integrated communication FETs which are connected to the pins COMM1 and COMM2. These FETs are used for modulating the secondary load current which allows bq51003 to communicate error control and configuration information to the transmitter. Figure 26 shows how the COMM pins can be used for resistive load modulation. Each COMM pin can handle at most a 24-Ω communication resistor. Therefore, if a COMM resistor between 12 Ω and 24 Ω is required COMM1 and COMM2 pins must be connected in parallel. The bq51003 does not support a COMM resistor less than 12 Ω.

Figure 26. Resistive Load Modulation

In addition to resistive load modulation, the bq51003 is also capable of capacitive load modulation as shown in Figure 27. In this case, a capacitor is connected from COMM1 to AC1 and from COMM2 to AC2. When the COMM switches are closed there is effectively a 22-nF capacitor connected between AC1 and AC2. Connecting a capacitor in between AC1 and AC2 modulates the impedance seen by the coil, which will be reflected in the primary as a change in current.

Figure 27. Capacitive Load Modulation

8.3.11 Adaptive Communication Limit

The Qi communication channel is established through backscatter modulation as described in the previous sections. This type of modulation takes advantage of the loosely coupled inductor relationship between the Rx and Tx coil. Essentially the switching in-and-out of the communication capacitor or resistor adds a transient load to the Rx coil to modulate the Tx coil voltage and current waveform (amplitude modulation). The consequence of this technique is that a load transient (load current noise) from the mobile device has the same signature. To provide noise immunity to the communication channel, the output load transients must be isolated from the Rx coil. The proprietary feature *Adaptive Communication Limit* achieves this by dynamically adjusting the current limit of the regulator. When the regulator is put in current limit, any load transients will be offloaded to the battery in the system.

Note that this requires the battery charger IC to have input voltage regulation (weak adapter mode). The output of the Rx appears as a weak supply if a transient occurs above the current limit of the regulator.

The Adaptive Communication Limit feature has two current limit modes and is detailed in [Table 6](#):

Table 6. Adaptive Communication Limit

I_{OUT}	COMMUNICATION CURRENT LIMIT
< 300 mA	Fixed 400 mA
> 300 mA	$I_{OUT} + 50$ mA

8.3.12 Synchronous Rectification

The bq51003 provides an integrated, self-driven synchronous rectifier that enables high-efficiency AC to DC power conversion. The rectifier consists of an all NMOS H-Bridge driver where the backgates of the diodes are configured to be the rectifier when the synchronous rectifier is disabled. During the initial start-up of the WPC system the synchronous rectifier is not enabled. At this operating point, the DC rectifier voltage is provided by the diode rectifier. Once V_{RECT} is greater than UVLO, half-synchronous mode will be enabled until the load current surpasses 120 mA. Above 120 mA the full synchronous rectifier stays enabled until the load current drops back below 100 mA where half-synchronous mode is enabled instead.

8.3.13 Temperature Sense Resistor Network (TS)

bq51003 includes a ratiometric external temperature sense function. The temperature sense function has two ratiometric thresholds which represent a hot and cold condition. TI recommends an external temperature sensor to provide safe operating conditions for the receiver product. This pin is best used for monitoring the surface that can be exposed to the end user (that is, place the NTC resistor closest to the user).

Figure 28 allows for any NTC resistor to be used with the given V_{HOT} and V_{COLD} thresholds.

Figure 28. NTC Circuit Used for Safe Operation of the Wireless Receiver Power Supply

The resistors R_1 and R_3 can be solved by resolving the system of equations at the desired temperature thresholds (see Equation 3 and Equation 4).

$$\%V_{COLD} = \frac{\left(\frac{R_3 (R_{NTC|TCOLD} + R_1)}{R_3 + (R_{NTC|TCOLD} + R_1)} \right)}{\left(\frac{R_3 (R_{NTC|TCOLD} + R_1)}{R_3 + (R_{NTC|TCOLD} + R_1)} \right) + R_2} \times 100$$

$$\%V_{HOT} = \frac{\left(\frac{R_3 (R_{NTC|THOT} + R_1)}{R_3 + (R_{NTC|THOT} + R_1)} \right)}{\left(\frac{R_3 (R_{NTC|THOT} + R_1)}{R_3 + (R_{NTC|THOT} + R_1)} \right) + R_2} \times 100 \quad (3)$$

$$R_{NTC|TCOLD} = R_0 e^{\beta \left(\frac{1}{T_{COLD}} - \frac{1}{T_0} \right)}$$

$$R_{NTC|THOT} = R_0 e^{\beta \left(\frac{1}{T_{HOT}} - \frac{1}{T_0} \right)}$$

where

- T_{COLD} and T_{HOT} are the desired temperature thresholds in degrees Kelvin
- R_0 is the nominal resistance
- and β is the temperature coefficient of the NTC resistor
- R_0 is fixed at 20 k Ω

(4)

An example solution is provided:

- $R_1 = 4.23 \text{ k}\Omega$
- $R_3 = 66.8 \text{ k}\Omega$

where the chosen parameters are:

- $\%V_{HOT} = 19.6\%$

- $\%V_{\text{COLD}} = 58.7\%$
- $T_{\text{COLD}} = -10^{\circ}\text{C}$
- $T_{\text{HOT}} = 100^{\circ}\text{C}$
- $\beta = 3380$
- $R_0 = 10\text{ k}\Omega$

Figure 29 shows the plot of the percent V_{TSB} vs temperature.

Figure 29. Example Solution for an NTC resistor with $R_0 = 10\text{ k}\Omega$ and $\beta = 4500$

Figure 30 illustrates the periodic biasing scheme used for measuring the TS state. The TS_READ signal enables the TS bias voltage for 24 ms. During this period the TS comparators are read (each comparator has a 10-ms deglitch) and appropriate action is taken based on the temperature measurement. After this 24-ms period has elapsed, the TS_READ signal goes low, which causes the TS-Bias pin to become high impedance. During the next 35 ms (priority packet period) or 235 ms (standard packet period), the TS voltage is monitored and compared to 100 mV. If the TS voltage is greater than 100 mV then a secondary device is driving the TS-CTRL pin and a CTRL = '1' is detected.

Figure 30. Timing Diagram for TS Detection Circuit

8.3.14 3-State Driver Recommendations for the TS-CTRL Pin

The TS-CTRL pin offers three functions with one 3-state driver interface

1. NTC temperature monitoring,
2. Fault indication,
3. Charge done indication

A 3-state driver can be implemented with the circuit in [Figure 31](#) and the use of two GPIO connections.

Figure 31. 3-State Driver for TS-CTRL

Note that the signals TERM and FAULT are given by two GPIOs. The truth table for this circuit is found in [Table 7](#):

Table 7. Truth Table

TERM	FAULT	F (Result)
1	0	Z (Normal Mode)
0	0	Charge Complete
1	1	System Fault

The default setting is TERM = 1 and FAULT = 0. In this condition, the TS-CTRL net is high impedance (hi-z) and; therefore, the NTC is function is allowed to operate. When the TS-CTRL pin is pulled to GND by setting FAULT = 1, the Rx is shut down with the indication of a fault. When the TS-CTRL pin is pulled to the battery by setting TERM = 1, the Rx is shut down with the indication of a charge complete condition. Therefore, the host controller can indicate whether the Rx is system is turning off due to a fault or due to a charge complete condition.

8.3.15 Thermal Protection

The bq51003 includes a thermal shutdown protection. If the die temperature reaches $T_{J(OFF)}$, the LDO is shut off to prevent any further power dissipation. In this case bq51003 will send an EPT message of internal fault (0x02).

8.3.16 WPC v1.2 Compliance – Foreign Object Detection

The bq51003 is a WPC v1.2 compatible device. To enable a Power Transmitter to monitor the power loss across the interface as one of the possible methods to limit the temperature rise of Foreign Objects, the bq51003 reports its Received Power to the Power Transmitter. The Received Power equals the power that is available from the output of the Power Receiver plus any power that is lost in producing that output power (the power loss in the Secondary Coil and series resonant capacitor, the power loss in the Shielding of the Power Receiver, the power loss in the rectifier). In WPC v1.2 specification, foreign object detection (FOD) is enforced. This means the bq51003 will send received power information with known accuracy to the transmitter.

WPC v1.2 defines Received Power as “the average amount of power that the Power Receiver receives through its Interface Surface, in the time window indicated in the Configuration Packet”.

To receive certification as a WPC v1.2 receiver, the Device Under Test (DUT) is tested on a Reference Transmitter whose transmitted power is calibrated, the receiver must send a received power determined by [Equation 5](#):

$$0 \text{ mW} < (\text{Tx PWR})_{\text{REF}} - (\text{Rx PWR out})_{\text{DUT}} < -250 \text{ mW} \quad (5)$$

This 250-mW bias ensures that system will remain interoperable.

WPC v1.2 Transmitter will be tested to see if they can detect reference Foreign Objects with a Reference receiver.

WPC v1.2 Specification will allow much more accurate sensing of Foreign Objects.

8.4 Device Functional Modes

The operational modes of the bq51003 are described in the [Feature Description](#). The bq51003 has several functional modes. Start-up refers to the initial power transfer and communication between the receiver (bq51003 circuit) and the transmitter. Power transfer refers to any time that the TX and RX are communicating and power is being delivered from the TX to the RX. Power transfer termination occurs when the RX is removed from the TX, power is removed from the TX, or the RX requests power transfer termination.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The bq51003 is a fully integrated wireless power receiver in a single device. The device complies with the WPC v1.2 specifications for a wireless power receiver. When paired with a WPC v1.2 compliant transmitter, it can provide up to 2.5 W of power. There are several tools available for the design of the system. These tools may be obtained by checking the product page at www.ti.com/product/bq51003.

9.2 Typical Applications

9.2.1 bq51003 Wireless Power Receiver Used as a Power Supply

The following application discussion covers the requirements for setting up the bq51003 in a Qi-compliant system for use as a power supply.

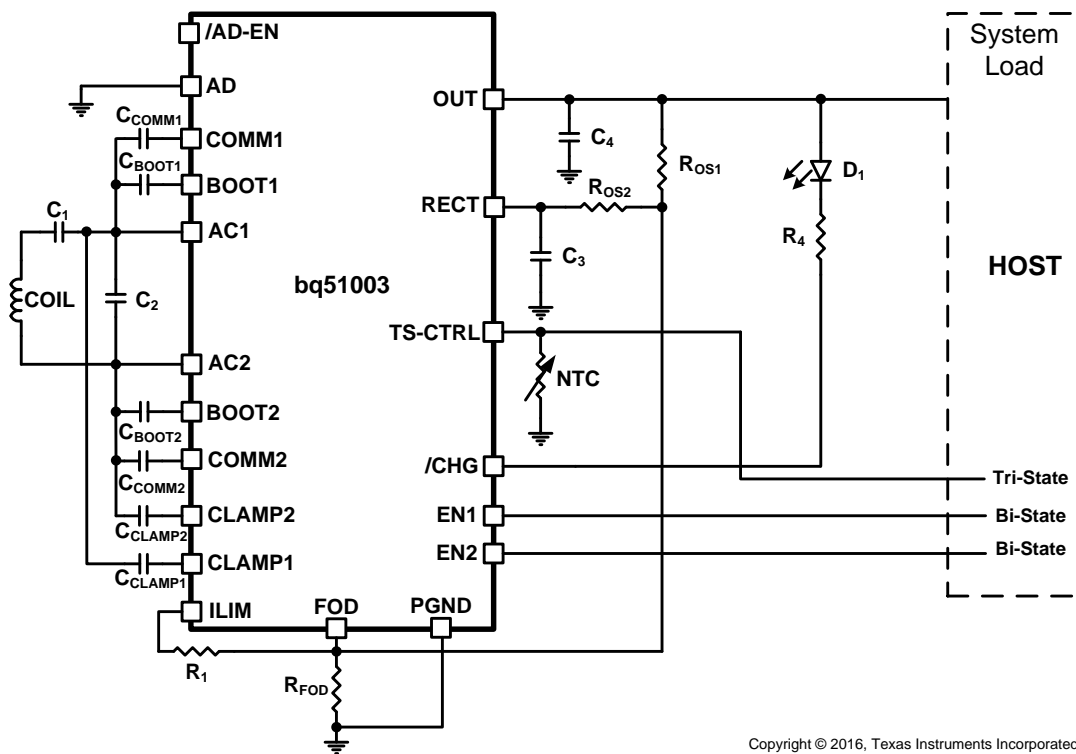

Figure 32. bq51003 Used as a Wireless Power Receiver and Power Supply for System Loads Only One of R_{OS1} or R_{OS2} Needed

9.2.1.1 Design Requirements

This application is for a system that has varying loads up to 500 mA (2.5 W). It must work with any Qi-certified transmitter. There is no requirement for any external thermal measurements. An LED indication is required to indicate an active power supply. Each of the components from the application drawing will be examined.

Typical Applications (continued)

9.2.1.2 Detailed Design Procedure

9.2.1.2.1 Using the bq51003 as a Wireless Power Supply

Figure 32 is the schematic of a system which uses the bq51003 as a power supply.

When the system shown in Figure 32 is placed on the charging pad, the receiver coil is inductively coupled to the magnetic flux generated by the coil in the charging pad which consequently induces a voltage in the receiver coil. The internal synchronous rectifier feeds this voltage to the RECT pin which has the filter capacitor C3.

The bq51003 identifies and authenticates itself to the primary using the COMM pins by switching on and off the COMM FETs and hence switching in and out C_{COMM} . If the authentication is successful, the transmitter will remain powered on. The bq51003 measures the voltage at the RECT pin, calculates the difference between the actual voltage and the desired voltage $V_{RECT-REG}$, (threshold 1 at no load) and sends back error packets to the primary. This process goes on until the input voltage settles at $V_{RECT-REG}$. During a load transient, the dynamic rectifier algorithm will set the targets specified by $V_{RECT-REG}$ thresholds 1, 2, 3, and 4. This algorithm is termed Dynamic Rectifier Control and is used to enhance the transient response of the power supply.

During power up, the LDO is held off until the $V_{RECT-REG}$ threshold 1 converges. The voltage control loop ensures that the output voltage is maintained at $V_{OUT-REG}$ to power the system. The bq51003 meanwhile continues to monitor the input voltage, and maintains sending error packets to the primary every 250 ms. If a large overshoot occurs, the feedback to the primary speeds up to every 32 ms to converge on an operating point in less time.

9.2.1.2.2 Series and Parallel Resonant Capacitor Selection

Shown in Figure 32, the capacitors C1 (series) and C2 (parallel) make up the dual resonant circuit with the receiver coil. These two capacitors must be sized correctly per the WPC v1.2 specification. Figure 33 illustrates the equivalent circuit of the dual resonant circuit:

Figure 33. Dual Resonant Circuit With the Receiver Coil

Section 4.2 (Power Receiver Design Requirements) in Part 1 of the WPC v1.2 specification highlights in detail the sizing requirements. To summarize, the receiver designer will be required take inductance measurements with a fixed test fixture. Figure 34 shows the test fixture.

Typical Applications (continued)

Figure 34. WPC v1.2 Receiver Coil Test Fixture for the Inductance Measurement Ls' (Copied from System Description Wireless Power Transfer, Volume 1: Low Power, Part 1 Interface Definition, Version 1.2)

The primary shield is to be 50 mm x 50 mm x 1 mm of Ferrite material PC44 from TDK Corp. The gap d_z is to be 3.4 mm. The receiver coil, as it will be placed in the final system (that is, the back cover and battery must be included if the system calls for this), is to be placed on top of this surface and the inductance is to be measured at 1-V RMS and a frequency of 100 kHz. This measurement is termed L_s' . The same measurement is to be repeated without the test fixture shown in Figure 34. This measurement is termed L_s or the free-space inductance. Each capacitor can then be calculated using Equation 6:

$$C_1 = \left[(f_S \times 2\pi)^2 \times L_S' \right]^{-1}$$

$$C_2 = \left[(f_D \times 2\pi)^2 \times L_S - \frac{1}{C_1} \right]^{-1}$$

where

- f_S is 100 kHz +5/-10%
- f_D is 1 MHz \pm 10%.

(6)

C1 must be chosen first prior to calculating C2.

The quality factor must be greater than 77 and can be determined by Equation 7:

$$Q = \frac{2\pi \cdot f_D \cdot L_S}{R}$$

where

- R is the DC resistance of the receiver coil. All other constants are defined above.

(7)

9.2.1.2.3 COMM, CLAMP, and BOOT Capacitors

For most applications, the COMM, CLAMP, and BOOT capacitance values will be chosen to match the bq51003EVM-764.

The BOOT capacitors are used to allow the internal rectifier FETs to turn on and off properly. These capacitors are from AC1 to BOOT1 and from AC2 to BOOT2 and must have a minimum 25-V rating. A 10-nF capacitor with a 25-V rating is chosen.

Typical Applications (continued)

The CLAMP capacitors are used to aid in the clamping process to protect against overvoltage. These capacitors are from AC1 to CLAMP1 and from AC2 to CLAMP2 and must have a minimum 25-V rating. A 0.47- μ F capacitor with a 25-V rating is chosen.

The COMM capacitors are used to facilitate the communication from the RX to the TX. This selection can vary a bit more than the BOOT and CLAMP capacitors. In general, TI recommends an 22-nF capacitor. Based on the results of testing of the communication robustness in the final solution, a change to a 47-nF capacitor may be in order. The larger the capacitor the larger the deviation will be on the coil which sends a stronger signal to the TX. This also decreases the efficiency somewhat. In this case, a 22-nF capacitor with a 25-V rating is chosen.

9.2.1.2.4 Control Pins and $\overline{\text{CHG}}$

This section discusses the pins that control the functions of the bq51003 (AD, $\overline{\text{AD_EN}}$, EN1, EN2, and TS or CTRL).

This solution uses wireless power exclusively. The AD pin is tied low to disable wired power interaction. The output pin $\overline{\text{AD_EN}}$ is left floating.

EN1 and EN2 are tied to the system controller GPIO pins. This allows the system to control the wireless power transfer. Normal operation leaves EN1 and EN2 low or floating (GPIO low or high impedance). EN1 and EN2 have internal pulldown resistors. With both EN1 and EN2 low, wireless power is enabled and power can be transferred whenever the RX is on a suitable TX. The RX system controller can terminate power transfer and send an EPT 0x01 (Charge Complete) by setting EN1=EN2=1. The TX will terminate power when the EPT 0x01 is received. The TX will continue to test for power transfer, but will not engage until the RX requests power. For example, if the TX is the bq500212A, the TX will send digital pings approximately once per 5 seconds. During each ping, the bq51003 will resend the EPT 0x01. Between the pings, the bq500212A goes into low power Sleep mode reducing power consumption. When the RX system controller determines it is time to resume power transfer (for example, the battery voltage is below its recharge threshold) the controller simply returns EN1 and EN2 to low (or float) states. The next ping of the bq500212A will power the bq51003 which will now communicate that it is time to transfer power. The TX and RX communication resumes and power transfer is reinitiated.

The TS or CTRL pin will be used as a temperature sensor (with the NTC) and maintain the ability to terminate power transfer through the system controller. In this case, the GPIO will be in high impedance for normal NTC (Temperature Sense) control.

The $\overline{\text{CHG}}$ pin is used to indicate power transfer. A 2.1-V forward bias LED is used for D₁ with a current limiting 1.5-k Ω series resistor. The LED and resistor are tied from OUT to PGND and D₁ will light during power transfer.

9.2.1.2.5 Current Limit and FOD

The current limit and foreign object detection functions are related. The current limit is set by $R_1 + R_{\text{FOD}}$. R_{FOD} and R_{os} are determined by FOD calibration. Default values of 20 k Ω for R_{os1} (RECT to FOD). R_{os2} (OUT to FOD) remains open. 196 Ω for R_{FOD} is used. The final values need to be determined based on the FOD calibration. The tool for FOD calibration can be found on the bq51003 web folder under *Tools & software*. Good practice is to set the layout with 2 resistors for R_{os} and 2 for R_{FOD} to allow for precise values once the calibration is complete.

After setting R_{FOD} , R_1 can be calculated based on the desired current limit. The maximum current for this solution under normal operating conditions (I_{MAX}) is 500 mA. Using Equation 2 to calculate the maximum current yields a value of 524 Ω for R_{LIM} . With R_{FOD} set to 196 Ω the remaining resistance for R_1 is 328 Ω . This also sets the hardware current limit to 600 mA to allow for temporary current surges without system performance concerns.

9.2.1.2.6 RECT and OUT Capacitance

RECT capacitance is used to smooth the AC to DC conversion and to prevent minor current transients from passing to OUT. For this 500-mA I_{MAX} , select two 10- μ F capacitors and one 0.1- μ F capacitor. These should be rated to 16 V.

OUT capacitance is used to reduce any ripple from minor load transients. For this solution, a single 10- μ F capacitor and a single 0.1- μ F capacitor are used.

Typical Applications (continued)

9.2.1.3 Application Curves

The following figures show the bq51003EVM-764 under 3 conditions. The RECT pin signal shows the bq51003 rectifier response due to the changing conditions. The OUT pin signal shows the impact to the OUT pin during the changed conditions. IOOUT shows the current being sourced by the OUT pin.

Figure 35 shows the bq51003EVM-764 being placed on a transmitter with no load at the OUT pin. This shows the RECT pin receiving the Ping from the transmitter and responding with identification and other packets to establish power transfer. Once the RECT pin has reached its required voltage, the OUT pin is enabled and produces 5 V. The communication packet after 5 V is produced indicates the steady state condition being sent to the transmitter.

Figure 36 shows the same conditions, but the OUT pin has a resistive load which produces 400 mA at 5 V. The OUT pin current, IOOUT, increases with the OUT pin voltage. The communication packets that occur after IOOUT increases are sent to adjust the RECT voltage to the appropriate level.

Figure 37 shows the bq51003 under a no load condition until a 400-mA resistive load is added. Communication packets are sent until the RECT has come to the appropriate steady state value.

Figure 35. bq51003 Added to TX With No Load

Figure 36. bq51003 Added to TX With 400-mA Resistive Load

Figure 37. bq51003 – No Load to 400-mA Resistive Load

Typical Applications (continued)

9.2.2 Dual Power Path: Wireless Power and DC Input

This application discussion expands the bq51003 in a Qi-compliant system from the previous solution and adds a secondary DC input. The bq51003 reacts to the added power and disables wireless power transfer then passes the DC voltage. When the DC voltage is removed, the bq51003 reinitiates wireless power transfer then enables its OUT pin.

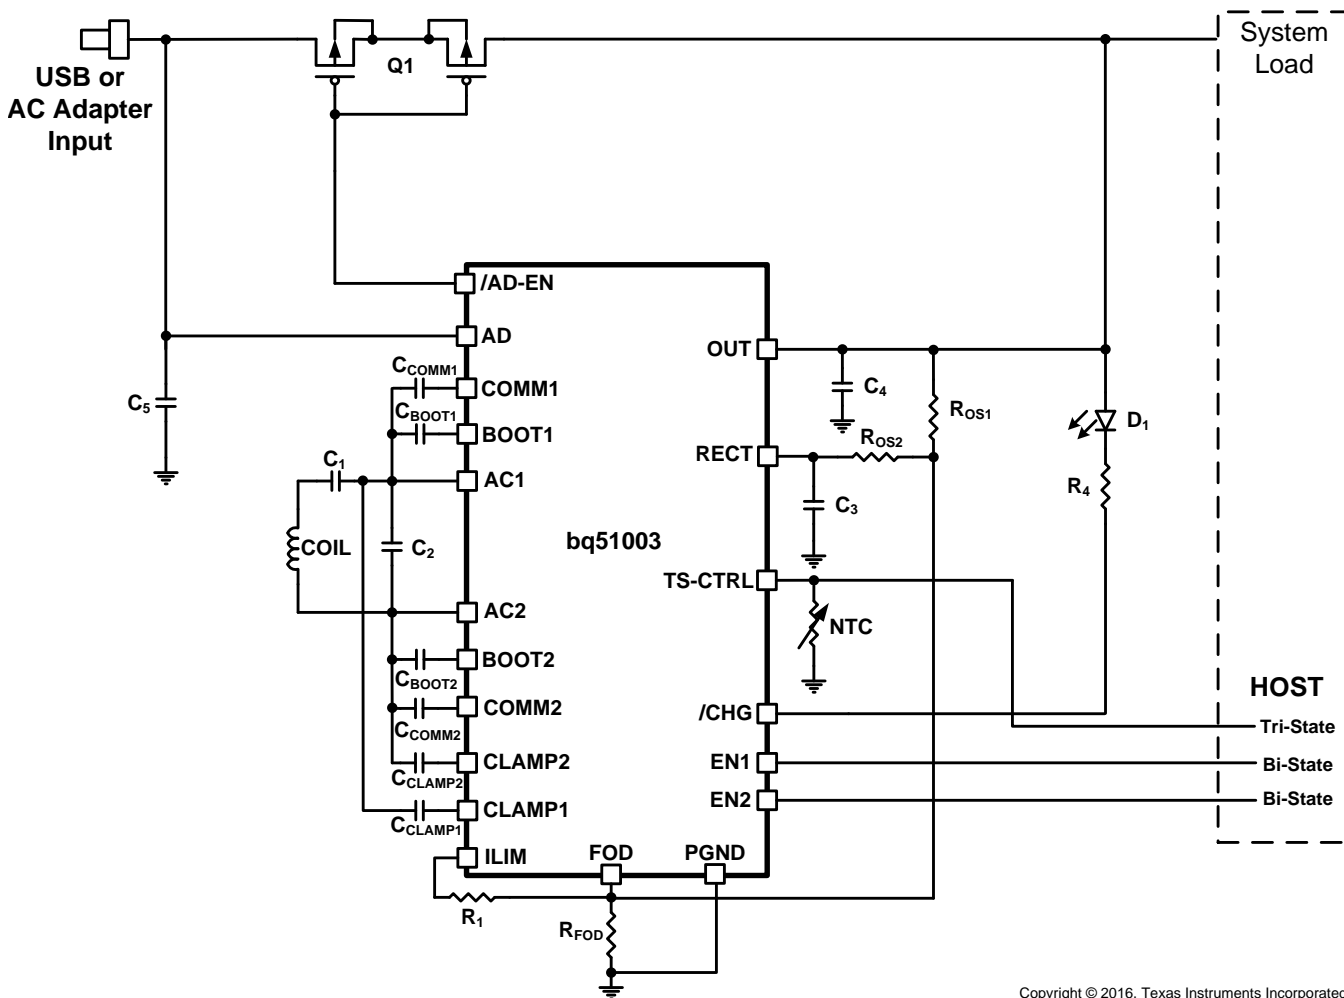

Figure 38. bq51003 Used as a Wireless Power Receiver and Power Supply for System Loads with Adapter Power-Path Multiplexing Only One of R_{OS1} or R_{OS2} Needed

9.2.2.1 Design Requirements

This solution adds the ability to disable wireless charging with the AD and $\overline{AD_EN}$ pins. A DC supply (USB or AC adapter with DC output) can also be used to power the subsystem. This can occur during wireless power transfer or without wireless power transfer. The system must allow power transfer without any backflow or damage to the circuitry.

Typical Applications (continued)

9.2.2.2 Detailed Design Procedure

The basic components used in Figure 32 are reused here in Figure 38. The additional circuitry needed for source control will be discussed. Adding a blocking FET while using the bq51003 for control is the only addition to the circuitry. The AD pin will be tied to the DC input as a threshold detector. The AD_EN pin will be used to enable or disable the blocking FET. The blocking FET must be chosen to handle the appropriate current level and the DC voltage level supplied from the input. In this example, the expectation is that the DC input will be 5 V with a maximum current of 500 mA (same configuration as the wireless power supply). The CSD75207W15 is a good fit because it is a P-Channel, -20-V, 3.9-A FET pair in a 1.5-mm² WCSP.

9.2.2.3 Application Curves

The following figures show the bq51003EVM-764 when DC voltage is applied to the AD pin and when it is removed. The AD pin signal shows when the DC power is applied or removed. The AD_EN signal shows the response of to the added or removed power on the AD pin. The OUT pin signal shows the impact to the OUT pin during the AD addition or removal. IOUT shows the current being sourced by the OUT pin. The resistive load is set to produce 400 mA at 5 V. On both of the following plots, note the communication packets are not present when AD_EN is low.

Figure 39 shows the bq51003EVM-764 when a power source is added to the AD pin. The bq51003 disables the OUT pin then sets AD_EN to low which enables the CSD75207W15, passing the DC voltage to the load.

Figure 40 shows the response when the DC voltage is removed. Note the time after the removal before OUT is enabled which allows the bq51003 to communicate with the transmitter to get RECT back to the correct level.

Figure 39. DC Voltage is Added at AD

Figure 40. DC Voltage is Removed from AD

10 Power Supply Recommendations

The bq51003 requires a Qi-compatible transmitter as its power source.

11 Layout

11.1 Layout Guidelines

- Keep the trace resistance as low as possible on AC1, AC2, and BAT.
- Detection and resonant capacitors must be placed as close to the device as possible.
- COMM, CLAMP, and BOOT capacitors must be placed as close to the device as possible.
- Via interconnect on PGND net is critical for appropriate signal integrity and proper thermal performance.
- High-frequency bypass capacitors must be placed close to RECT and OUT pins.
- ILIM and FOD resistors are important signal paths and the loops in those paths to PGND must be minimized.

Signal and sensing traces are the most sensitive to noise; the sensing signal amplitudes are usually measured in mV, which is comparable to the noise amplitude. Make sure that these traces are not being interfered by the noisy and power traces. AC1, AC2, BOOT1, BOOT2, COMM1, and COMM2 are the main source of noise in the board. These traces should be shielded from other components in the board. It is usually preferred to have a ground copper area placed underneath these traces to provide additional shielding. Also, make sure they do not interfere with the signal and sensing traces. The PCB should have a ground plane (return) connected directly to the return of all components through vias (two vias per capacitor for power-stage capacitors, one via per capacitor for small-signal components).

For a 1-A fast charge current application, the current rating for each net is as follows:

- AC1 = AC2 = 1.2 A
- OUT = 500 mA
- RECT = 100 mA (RMS)
- COMMx = 300 mA
- CLAMPx = 500 mA
- All others can be rated for 10 mA or less

13 机械、封装和可订购信息

以下页中包括机械封装和可订购信息。这些信息是针对指定器件可提供的最新数据。这些数据会在无通知且不对本档进行修订的情况下发生改变。欲获得该数据表的浏览器版本，请查阅左侧的导航栏。

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
BQ51003YFPR	ACTIVE	DSBGA	YFP	28	3000	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-40 to 85	BQ51003	Samples
BQ51003YFPT	ACTIVE	DSBGA	YFP	28	250	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-40 to 85	BQ51003	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

重要声明

德州仪器 (TI) 公司有权按照最新发布的 JESD46 对其半导体产品和服务进行纠正、增强、改进和其他修改，并不再按最新发布的 JESD48 提供任何产品和服务。买方在下订单前应获取最新的相关信息，并验证这些信息是否完整且是最新的。

TI 公布的半导体产品销售条款 (<http://www.ti.com/sc/docs/stdterms.htm>) 适用于 TI 已认证和批准上市的已封装集成电路产品的销售。另有其他条款可能适用于其他类型 TI 产品及服务的使用或销售。

复制 TI 数据表上 TI 信息的重要部分时，不得变更该等信息，且必须随附所有相关保证、条件、限制和通知，否则不得复制。TI 对该等复制文件不承担任何责任。第三方信息可能受到其它限制条件的制约。在转售 TI 产品或服务时，如果存在对产品或服务参数的虚假陈述，则会失去相关 TI 产品或服务的明示或暗示保证，且构成不公平的、欺诈性商业行为。TI 对此类虚假陈述不承担任何责任。

买方和在系统中整合 TI 产品的其他开发人员（总称“设计人员”）理解并同意，设计人员在设计应用时应自行实施独立的分析、评价和判断，且应全权负责并确保应用的安全性，及设计人员的应用（包括应用中使用的 TI 产品）应符合所有适用的法律法规及其他相关要求。设计人员就自己设计的应用声明，其具备制订和实施下列保障措施所需的一切必要专业知识，能够 (1) 预见故障的危险后果，(2) 监视故障及其后果，以及 (3) 降低可能导致危险的故障几率并采取适当措施。设计人员同意，在使用或分发包含 TI 产品的任何应用前，将彻底测试该等应用和该等应用中所用 TI 产品的功能。

TI 提供技术、应用或其他设计建议、质量特点、可靠性数据或其他服务或信息，包括但不限于与评估模块有关的参考设计和材料（总称“TI 资源”），旨在帮助设计人员开发整合了 TI 产品的应用，如果设计人员（个人，或如果是代表公司，则为设计人员的公司）以任何方式下载、访问或使用任何特定的 TI 资源，即表示其同意仅为该等目标，按照本通知的条款使用任何特定 TI 资源。

TI 所提供的 TI 资源，并未扩大或以其他方式修改 TI 对 TI 产品的公开适用的质保及质保免责声明；也未导致 TI 承担任何额外的义务或责任。TI 有权对其 TI 资源进行纠正、增强、改进和其他修改。除特定 TI 资源的公开文档中明确列出的测试外，TI 未进行任何其他测试。

设计人员只有在开发包含该等 TI 资源所列 TI 产品的应用时，才被授权使用、复制和修改任何相关 TI 资源。但并未依据禁止反言原则或其他法律授予您任何 TI 知识产权的任何其他明示或默示的许可，也未授予您 TI 或第三方的任何技术或知识产权的许可，该等许可包括但不限于任何专利权、版权、屏蔽作品权或与美国 TI 产品或服务的任何整合、机器制作、流程相关的其他知识产权。涉及或参考了第三方产品或服务的信息不构成使用此类产品或服务的许可或与其相关的保证或认可。使用 TI 资源可能需要您向第三方获得对该等第三方专利或其他知识产权的许可。

TI 资源系“按原样”提供。TI 兹免除对资源及其使用作出所有其他明确或默示的保证或陈述，包括但不限于对准确性或完整性、产权保证、无屡发故障保证，以及适销性、适合特定用途和不侵犯任何第三方知识产权的任何默认保证。TI 不负责任何申索，包括但不限于因组合产品所致或与之有关的申索，也不为或对设计人员进行辩护或赔偿，即使该等产品组合已列于 TI 资源或其他地方。对因 TI 资源或其使用引起或与之有关的任何实际的、直接的、特殊的、附带的、间接的、惩罚性的、偶发的、从属或惩戒性损害赔偿，不管 TI 是否获悉可能会产生上述损害赔偿，TI 概不负责。

除 TI 已明确指出特定产品已达到特定行业标准（例如 ISO/TS 16949 和 ISO 26262）的要求外，TI 不对未达到任何该等行业标准要求而承担任何责任。

如果 TI 明确宣称产品有助于功能安全或符合行业功能安全标准，则该等产品旨在帮助客户设计和创作自己的符合相关功能安全标准和要求的的应用。在应用内使用产品的行为本身不会配有安全特性。设计人员必须确保遵守适用于其应用的相关安全要求和标准。设计人员不可将任何 TI 产品用于关乎性命的医疗设备，除非已由各方获得授权的管理人员签署专门的合同对此类应用专门作出规定。关乎性命的医疗设备是指出现故障会导致严重身体伤害或死亡的医疗设备（例如生命保障设备、心脏起搏器、心脏除颤器、人工心脏泵、神经刺激器以及植入设备）。此类设备包括但不限于，美国食品药品监督管理局认定为 III 类设备的设备，以及在美国以外的其他国家或地区认定为同等类别设备的所有医疗设备。

TI 可能明确指定某些产品具备某些特定资格（例如 Q100、军用级或增强型产品）。设计人员同意，其具备一切必要专业知识，可以为自己的应用选择适合的产品，并且正确选择产品的风险由设计人员承担。设计人员单方面负责遵守与该等选择有关的所有法律或监管要求。

设计人员同意向 TI 及其代表全额赔偿因其不遵守本通知条款和条件而引起的任何损害、费用、损失和/或责任。
