NC − No internal connection

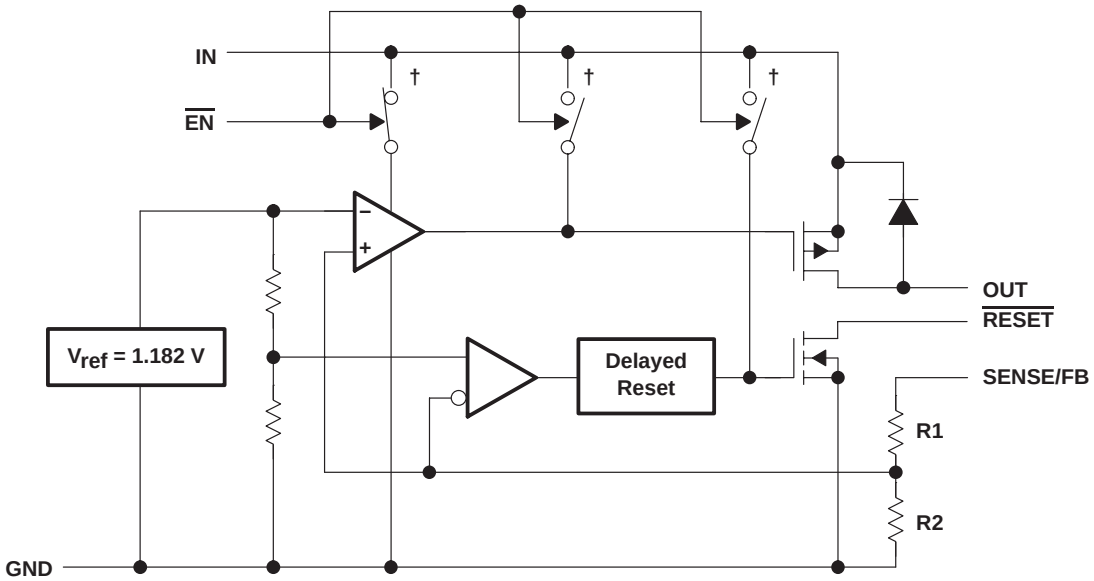
description

The TPS73HD3xx family of dual voltage regulators offers very low dropout voltages and dual outputs in a compact package. Designed primarily for DSP applications, these devices can be used in any mixed-output voltage application with each regulator supporting up to 750 mA. Output current can be allocated as desired between the two regulators and used to power many of todays DSPs. Low quiescent current and very low dropout voltage assure maximum power usage in battery-powered applications. Texas Instruments PowerPAD TSSOP package allows use of these devices with any voltage/current combination within the range of the listed specifications without thermal problems, provided proper device mounting procedures are followed. Separate inputs allow the designer to configure the source power as desired. Dual active-low reset signals allow resetting of core-logic and I/O separately. Remote sense/feedback terminals provide regulation at the load. The TPS73HD3xx are available in 28-pin PowerPAD TSSOP. They operate over a free-air temperature range of −40°C to 125°C.

AVAILABLE OPTIONS

T_A	REGULATOR 1 V_O (V)	REGULATOR 2 V_O (V)	TSSOP (PWP)
−40°C to 125°C	Adj (1.2 − 9.75 V)	3.3 V	TPS73HD301PWPR
	1.8 V	3.3 V	TPS73HD318PWPR
	2.5 V	3.3 V	TPS73HD325PWPR

functional block diagram



† Switch positions shown with $\overline{EN}$ low (active).

OUTPUT VOLTAGE	R1	R2	UNIT
Adjustable	0	∞	Ω
1.8 V	122	233	kΩ
2.5 V	260	233	kΩ
3.3 V	420	233	kΩ

Terminal Functions

TERMINAL NAME	TERMINAL NO.	I/O	DESCRIPTION
NC	1, 2, 7, 8, 13−16, 20, 21, 26, 27		No connection
1GND	3		Regulator #1 ground
$\overline{1EN}$	4	I	Regulator #1 enable, low = enable
1IN	5, 6	I	Regulator #1 input supply voltage
2GND	9		Regulator #2 ground
$\overline{2EN}$	10	I	Regulator #2 enable, low = enable
2IN	11, 12	I	Regulator #2 input supply voltage
2OUT	17, 18	O	Regulator #2 output voltage
2SENSE	19	I	Regulator #2 output voltage sense (fixed output)
$\overline{2RESET}$	22	O	Regulator #2 reset signal, low = reset
1OUT	23, 24	O	Regulator #1 output voltage
1FB/SENSE	25	I	Regulator #1 output voltage feedback (adjustable output)
$\overline{1RESET}$	28	O	Regulator #1 reset signal, low = reset

absolute maximum ratings over operating free-air temperature (unless otherwise noted)†

Input voltage range, V_I (xIN, $\overline{\text{xRESET}}$, xSENSE, $\overline{\text{xEN}}$) . . . . . −0.3 V to 11 V
Differential input voltage,V_{ID} (1GND to 2GND) . . . . . 2 V
Output current, I_O (1OUT, 2OUT) . . . . . 2 A
Continuous total power dissipation . . . . . See Dissipation Rating Tables
Operating free-air temperature range, T_A . . . . . −40°C to 125°C
Storage temperature range, T_{stg} . . . . . −65°C to 150°C
Lead temperature soldering 1,6 mm (1/16 inch) from case for 10 seconds . . . . . 260°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: All voltages are with respect to GND.

DISSIPATION RATING TABLE 1 − FREE-AIR TEMPERATURES‡

PACKAGE	AIR FLOW (CFM)	T_A < 25°C POWER RATING	DERATING FACTOR ABOVE T_A = 25°C	T_A = 70°C POWER RATING	T_A = 85°C POWER RATING
PWP‡	0	2.9 W	23.5 mW/°C	1.9 W	1.5 W
	300	4.3 W	34.6 mW/°C	2.8 W	2.2 W
PWP§	0	3 W	23.8 mW/°C	1.9 W	1.5 W
	300	7.2 W	57.9 mW/°C	4.6 W	3.8 W

‡ This parameter is measured with the recommended copper heat sink pattern on a 1-layer PCB, 5-in × 5-in PCB, 1 oz. copper, 2-in × 2-in coverage (4 in^2).

§ This parameter is measured with the recommended copper heat sink pattern on a 8-layer PCB, 1.5-in × 2-in PCB, 1 oz. copper with layers 1, 2, 4, 5, 7, and 8 at 5% coverage (0.9 in^2) and layers 3 and 6 at 100% coverage (6 in^2).

recommended operating conditions

		MIN	MAX	UNIT
Input voltage, V_I†	Adjustable output (regulator #1)	2.97	10	V
Input voltage, V_I†	3.3−V output (regulator #2)	3.97	10	V
High-level input voltage at $\overline{\text{EN}}$, V_{IH}		2		V
Low-level input voltage at $\overline{\text{EN}}$, V_{IL}			0.5	V
Total output current range (per regulator), I_O		0	750	mA
Operating virtual junction temperature range, T_J		−40	125	°C

† Minimum input voltage defined in the recommended operating conditions is the maximum specified output voltage plus dropout voltage, V_{DO}, at the maximum specified load range (750 mA). Since dropout voltage is a function of output current, the usable range can be extended for lighter loads. To calculate the minimum input voltage for the maximum load current used in a given application, use the following equation:

$$V_{I(min)} = V_{O(max)} + V_{DO(max\ load)}$$

Because regulator 1 of the TPS373HD301 is programmable, $r_{DS(on)}$ should be used to calculate V_{DO} before applying the above equation. The equation for calculating V_{DO} from $r_{DS(on)}$ is given in Note 3 in the TPS73HD301 electrical characteristics table. The minimum value of 3.5 V is the absolute lower limit for the recommended input voltage range for the TPS73HD301. With 2.97-V input voltage, the LDO may be in dropout and will not meet the 3% regulaotr output or 750-mA load current specification.

electrical characteristics, $V_{I(IN)}$ = 4.3 V, I_O = 10 mA, $\overline{EN}$ = 0 V, C_O = 4.7 μF/CSR‡ = 1 Ω, SENSE/FB shorted to OUT (unless otherwise noted)

PARAMETER		TEST CONDITIONS§	T_J	MIN	TYP	MAX	UNIT

† CSR (compensation series resistance) refers to the total series resistance, including the equivalent series resistance (ESR) of the capacitor, any series resistance added externally, and PWB trace resistance to C_L.

‡ Pulse-testing techniques are used to maintain virtual junction temperature as close as possible to ambient temperature; thermal effects must be taken into account separately.

§ Output voltage programmed to 2.5 V with closed-loop configuration (see application information)

NOTE 3: To calculate dropout voltage, use equation:

$$V_{DO} = I_O \times r_{DS(ON)}$$

$r_{DS(ON)}$ is a function of both output current and input voltage. This parametric table lists $r_{DS(ON)}$ for V_I = 3.9 V and 5.9 V, which corresponds to dropout conditions for programmed output voltages of 4 V and 6 V respectively. For other programmed values, refer to Figure 29.

electrical characteristics, $V_{I(IN)}$ = 4.3 V, I_O = 10 mA, $\overline{EN}$ = 0 V, C_O = 4.7 μF/CSR† = 1 Ω, SENSE/FB shorted to OUT (unless otherwise noted) (continued)

THERMAL INFORMATION

The TPS73HD3xx is packaged in a high-power dissipation downset lead frame for optimal power handling. with proper heat dissipation techniques, the full power soutput of these devices can be safely handled over the full temperture range. The Texas Instruments technical brief, *PowerPAD Thermally Enhanced Package* (literature number SLMA002), goes into considerable detail into techniques for properly mounting this type of package for maximum thermal performance. A thermal conduction plane of approximately 3″ y 3″ will give a power dissipatio level of 4.5 W.

Power dissipation within the device can be calculated with the following equation:

$$P_D = P_{IN} - P_{OUT} = V_I\left(I_{O1} + I_{O2}\right) - \left(V_{O1} \times I_{O1} + V_{O2} \times I_{O2}\right)$$

APPLICATION INFORMATION

	300	7.2 W	57.9 mW/°C	4.6 W	3.8 W

† This parameter is measured with the recommended copper heat sink pattern on a 1-layer PCB, 5-in × 5-in PCB, 1 oz. copper, 2-in × 2-in coverage (4 in^2).

‡ This parameter is measured with the recommended copper heat sink pattern on an 8-layer PCB, 1.5-in × 2-in PCB, 1 oz. copper with layers 1, 2, 4, 5, 7, and 8 at 5% coverage (0.9 in^2) and layers 3 and 6 at 100% coverage (6 in^2).

The maximum ambient temperature depends on the heatsinking ability of the PCB system. Using the 0 CFM and 300 CFM data from the dissipation rating table, the derating factor for the PWP package with 6.9 in^2 of copper area on a multilayer PCB is 24 mW/°C and 58 mW/°C respectively. Converting this to Θ_{JA}:

$$\Theta_{JA} = \frac{1}{\text{Derating}}$$

For 0 CFM :

$$= \frac{1}{0.0235}$$

$$= 42.6°C/W$$

For 300 CFM :

$$= \frac{1}{0.0579}$$

$$= 17.3°C/W$$

Given Θ_{JA}, the maximum allowable junction temperature, and the total internal dissipation, the maximum ambient temperature can be calculated with the following equation. The maximum recommended junction temperature for the TPS73HD3xx is 150 °C.

$$T_A\,\text{Max} = T_J\,\text{Max} - \left(\Theta_{JA} \times P_D\right)$$

The maximum power dissipation limit is determined using the following equation:

$$T_{D(max)} = \frac{T_J\,\text{max} - T_A}{R_{\theta JA}}$$

Where:

$T_J$max is the maximum allowable junction temperature

$R_{\theta JA}$ is the thermal resistance junction-to-free-air for the package (i.e., 285°C/W for the 5-terminal SOT-23 package.

T_A is the free-air temperautre

The regulator dissipation is calculated using:

$$P_D = \left(V_I - V_O\right) \times 1_O$$

Power dissipation resulting from quiescent current is negligible.

APPLICATION INFORMATION

Capitalizing upon the features of the TPS73xx family (low-dropout voltage, low quiescent current, power-saving shutdown mode, and a supply-voltage supervisor) and the power-dissipation properties of the TSSOP PowerPAD package has enabled the integration of the TPS73HD3xx dual LDO regulator with high output current for use in DSP and other multiple voltage applications. Figure 35 shows a typical dual-voltage DSP application.

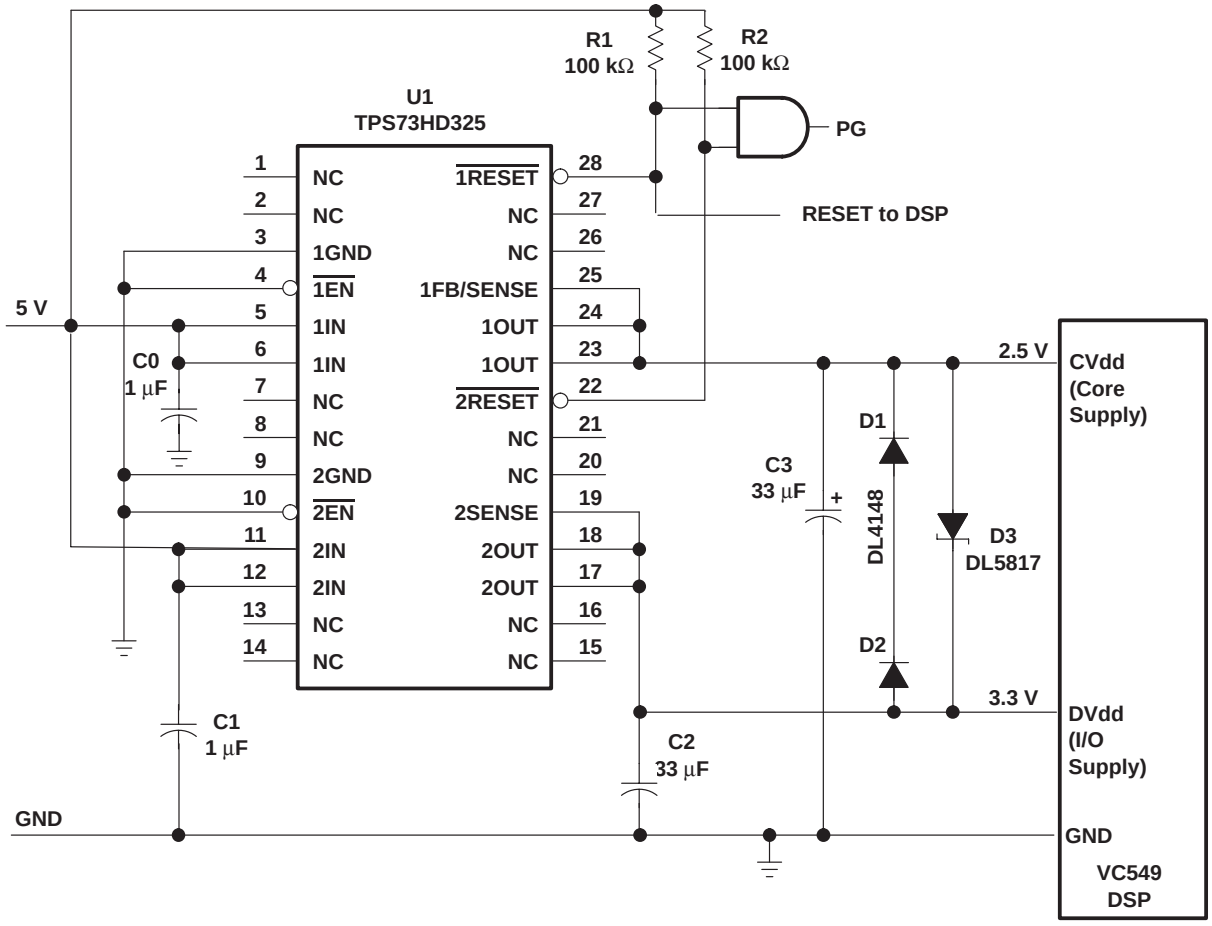

Figure 33. Dual-Voltage DSP Application

DSP power requirements include very high transient currents that must be considered in the initial design. This design uses higher-valued output capacitors to handle the large transient currents. Details of this type of design are shown in the application report, *Designing Power Supplies for TMS320VC549 DSP Systems.*

minimum load requirements

The TPS73HD3xx is stable even at zero load; no minimum load is required for operation.

APPLICATION INFORMATION

SENSE connection

The SENSE terminal of fixed-output devices must be connected to the regulator output for proper functioning of the regulator. Normally, this connection should be as short as possible; however, the connection can be made near a critical circuit (remote sense) to improve performance at that point. Internally, SENSE connects to a high-impedance wide-bandwidth amplifier through a resistor-divider network, and noise pickup feeds through to the regulator output. It is essential to route the SENSE connection in such a way as to minimize/avoid noise pickup. Adding an RC network between SENSE and OUT to filter noise is not recommended because it can cause the regulator to oscillate.

external capacitor requirements

An input capacitor is not required; however, a ceramic bypass capacitor (0.047 pF to 0.1 μF) improves load transient response and noise rejection when the TPS73HD3xx is located more than a few inches from the power supply. A higher-capacitance electrolytic capacitor may be necessary if large (hundreds of milliamps) load transients with fast rise times are anticipated.

As with most LDO regulators, the TPS73HD3xx requires an output capacitor for stability. A low-ESR 10-μF solid-tantalum capacitor connected from the regulator output to ground is sufficient to ensure stability over the full load range (see Figure 44). Adding high-frequency ceramic or film capacitors (such as power-supply bypass capacitors for digital or analog ICs) can cause the regulator to become unstable unless the ESR of the tantalum capacitor is less than 1.2 Ω over temperature. Capacitors with published ESR specifications such as the AVX TPSD106M035R0300 and the Sprague 593D106X0035D2W work well because the maximum ESR at 25°C is 300 mΩ (typically, the ESR in solid-tantalum capacitors increases by a factor of 2 or less when the temperature drops from 25°C to −40°C). Where component height and/or mounting area is a problem, physically smaller, 10-μF devices can be screened for ESR. Figures 23 through 28 show the stable regions of operation using different values of output capacitance with various values of ceramic load capacitance.

Due to the reduced stability range available when using output capacitors smaller than 10 μF, capacitors in this range are not recommended. Larger capacitors provide a wider range of stability and better load transient response. Because capacitor minimum ESR is seldom if ever specified, it may be necessary to add a 0.5-Ω to 1-Ω resistor in series with the capacitor and limit ESR to 1.5 Ω maximum. As shown in the CSR graphs (Figures 23 through 28), minimum ESR is not a problem when using 10-μF or larger output capacitors.

Below is a partial listing of surface-mount capacitors usable with the TPS73HD3xx. This information, along with the CSR graphs, is included to assist in selection of suitable capacitance for the user's application. When necessary to achieve low height requirements along with high output current and/or high ceramic load capacitance, several higher ESR capacitors can be used in parallel to meet the guidelines above.

APPLICATION INFORMATION

programming the adjustable LDO regulator output

Programming the adjustable regulator is done using an external resistor divider as shown in Figure 44. The equation governing the output voltage is:

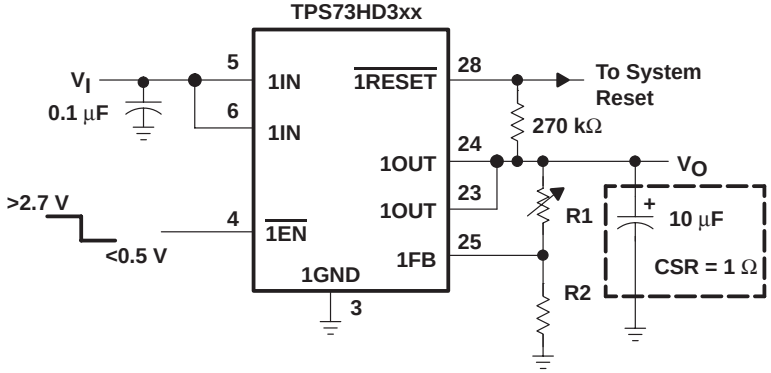
$$V_O = V_{ref} \times \left(1 + \frac{R1}{R2}\right)$$

Where

V_{ref} = reference voltage, 1.182 V typ

Resistors R1 and R2 should be chosen for approximately 7-μA divider current. A recommended value for R2 is 169 kΩ with R1 adjusted for the desired output voltage. Smaller resistors can be used, but offer no inherent advantage and consume more power. Larger values of R1 and R2 should be avoided as leakage currents at FB will introduce an error. Solving for R1 yields a more useful equation for choosing the appropriate resistance:

$$R1 = \left(\frac{V_O}{V_{ref}} - 1\right) \times R2$$



OUTPUT VOLTAGE PROGRAMMING GUIDE

OUTPUT VOLTAGE	RESET VOLTAGE	R1	R2	UNIT
1.5 V	−†	45.3	169	kΩ
1.8 V	−†	88.7	169	kΩ
2.5 V	2.37 V	191	169	kΩ

5 V	4.75 V	549	169	kΩ
6.4 V	6.08 V	750	169	kΩ

† Non-operational below 1.9 V

Figure 34. TPS7301 Adjustable LDO Regulator Programming

APPLICATION INFORMATION

undervoltage supervisor function

The $\overline{\text{RESET}}$ outputs of the TPS73HD3xx initiate a reset in microcomputer and microprocessor systems in the event of an undervoltage condition. An internal comparator in the TPS73HD3xx monitors the output voltage of the regulator to detect the undervoltage condition. When that occurs, the $\overline{\text{RESET}}$ output transistor turns on, taking the $\overline{\text{RESET}}$ signal low.

At programmed output voltages below 1.9 V (on the adjustable regulator only) and on the 1.8 V regulator the reset function becomes unusable. With a minimum output voltage requirement for a valid $\overline{\text{RESET}}$ signal (over temperature) being 1.9 V, $\overline{\text{RESET}}$ will not operate reliably in this range.

On power up, the output voltage tracks the input voltage. The $\overline{\text{RESET}}$ output becomes active (low) as V_I approaches the minimum required for a valid $\overline{\text{RESET}}$ signal (specified at 1.5 V for 25°C and 1.9 V over full recommended operating temperature range). When the output voltage reaches the appropriate positive-going input threshold (V_{IT+}), a 200-ms (typical) timeout period begins during which the $\overline{\text{RESET}}$ output remains low. Once the timeout has expired, the $\overline{\text{RESET}}$ output becomes inactive. Since the $\overline{\text{RESET}}$ output is an open-drain NMOS, a pullup resistor should be used to ensure that a logic-high signal is indicated.

The supply-voltage-supervisor function is also activated during power down. As the input voltage decays and after the dropout voltage is reached, the output voltage tracks linearly with the decaying input voltage. When the output voltage drops below the specified negative-going input threshold (V_{IT-} — see electrical characteristics tables), the $\overline{\text{RESET}}$ output becomes active (low). It is important to note that if the input voltage decays below the minimum required for a valid $\overline{\text{RESET}}$, the $\overline{\text{RESET}}$ is undefined.

Since the circuit is monitoring the regulator output voltage, the $\overline{\text{RESET}}$ output can also be triggered by disabling the regulator or by any fault condition that causes the output to drop below V_{IT-}. Examples of fault conditions include a short circuit on the output and a low input voltage. Once the output voltage is reestablished, either by reenabling the regulator or removing the fault condition, then the internal timer is initiated, which holds the $\overline{\text{RESET}}$ signal active during the 200-ms (typical) timeout period.

Transient loads or line pulses can also cause a reset to occur if proper care is not taken in selecting the input and output capacitors. Load transients that are faster than 5 μs can cause a reset if high-ESR output capacitors (greater than approximately 7 Ω) are used. A 1-μs transient causes a reset when using an output capacitor with greater than 3.5 Ω of ESR. Note that the output-voltage spike during the transient can drop well below the reset threshold and still not trip if the transient duration is short. A 1-μs transient must drop at least 500 mV below the threshold before tripping the reset circuit. A 2-μs transient trips $\overline{\text{RESET}}$ at just 400 mV below the threshold. Lower-ESR output capacitors help by reducing the drop in output voltage during a transient and should be used when fast transients are expected.

NOTE:

$V_{IT+} = V_{IT-}$ +Hysteresis

output noise

The TPS73HD3xx has very low output noise, with a spectral noise density < 2 μV/$\sqrt{\text{Hz}}$. This is important when noise-susceptible systems, such as audio amplifiers, are powered by the regulator.

APPLICATION INFORMATION

regulator protection

The TPS73HD3xx PMOS-pass transistors have built-in back diodes that safely conduct reverse currents when the input voltage drops below the output voltage (e.g., during power down). Current is conducted from the output to the input and is not internally limited. If extended reverse voltage is anticipated, external limiting might be appropriate.

The TPS73HD3xx also features internal current limiting and thermal protection. During normal operation, the TPS73HD3xx limits output current to approximately 1 A. When current limiting engages, the output voltage scales back linearly until the overcurrent condition ends. While current limiting is designed to prevent gross device failure, care should be taken not to exceed the power dissipation ratings of the package. If the temperature of the device exceeds 165°C, thermal-protection circuitry shuts it down. Once the device has cooled, regulator operation resumes.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

PWP (R–PDSO–G28) PowerPAD™ SMALL PLASTIC OUTLINE

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have ***not*** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
