General Description

SY6025 is a 20W, digital audio power amplifier for driving stereo bridge-tied speakers. One serial data input allows processing of up to two discrete audio channels and seamless integration to most digital audio processors. SY6025 is an I^2S slave device receiving all clocks from external sources.

.

Ordering Information

SY6025 □(□□)□
- Temperature Code
- Package Code
- Optional Spec Code

Ordering Number	Package type	Note
SY6025QHC	QFN6x6-40	

Features

- 20 W Into an 8Ω Load From a 24V Supply
- 15 W Into an 6Ω Load From a 18V Supply
- 10 W Into an 6Ω Load From a 13.2V Supply
- 2.0 Mode(2 BTL) or Single-Filter PBTL Mode Support
- 4.5V to 28V PVDD Range
- 32kHz to 96kHz Sample Rate Support (LJ/RJ/I^2S/DSP)
- I^2C Address Selection Pin
- Independent Channel Volume Controls with 48dB to Mute
- SDATA Generator (I^2S output)
- Two DC Blocking Filters
- 14 PEQs or 10 PEQs + 4 SPEQs each channel for Speaker Protection and Speaker Compensation
- 3 Bands Dynamic Range Control plus a Post Dynamic Range Control
- Loudness Control
- Power Level Meter
- I^2C Serial Control Interface Operational without MCLK
- Thermal, Over Current, Short Circuit Protection and BQ/DRC Checksum
- Support Automatic Audio Sample Rate Detection
- SY6025QHC Surface Mount, QFN 40Pin, 6mm×6mm
- BD or Ternary Mode Support

Applications

- LCD TV, LED TV or Monitor
- Digital Speaker, Bluetooth Speaker
- Sound Bar

Typical Application

Function Block

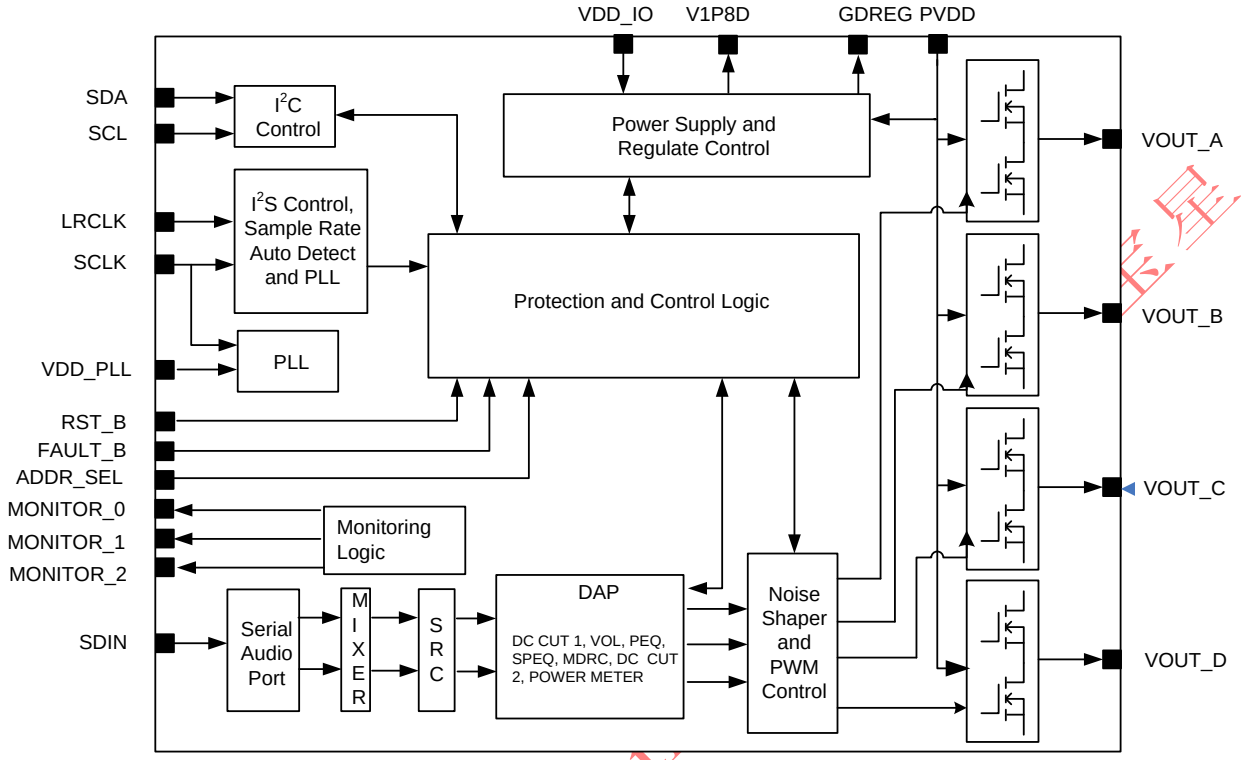

Figure2. Function Block

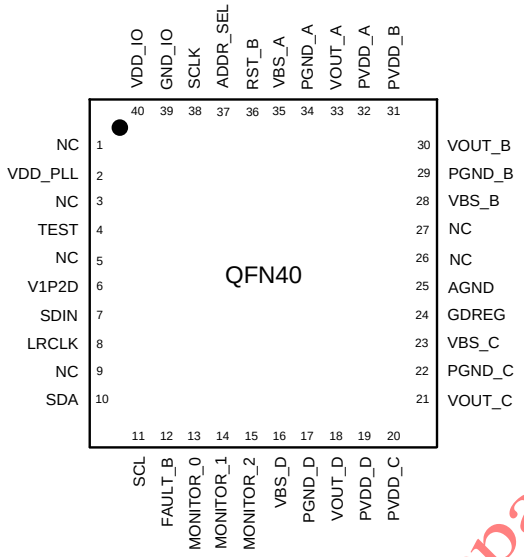
Pinout (top view)



Top mark: **BNX** ***xyz*** (Device code: **BNX**, ***x=year code, y=week code, z= lot number code***)

Pin Name	Pin Number	Type(1)	Termination(2)	Description
VOUT_A	33	O		Half-bridge A output.
VOUT_B	30	O		Half-bridge B output.
VOUT_C	21	O		Half-bridge C output.
VOUT_D	18	O		Half-bridge D output.
PVDD_A	32	P		Power supply for half-bridge A.
PVDD_B	31	P		Power supply for half-bridge B.
PVDD_C	20	P		Power supply for half-bridge C.
PVDD_D	19	P		Power supply for half-bridge D.
VBS_A	35	P		High side supply offset voltage for half-bridge A.
VBS_B	28	P		High side supply offset voltage for half-bridge B.
VBS_C	23	P		High side supply offset voltage for half-bridge C.
VBS_D	16	P		High side supply offset voltage for half-bridge D
GDREG	24	P		Gate driver internal regulator output. This pin must not be used to drive external devices.
GND_IO	39	P		Analog 3.3V power supply ground.
NC	1,3,5,9,26, 27			No Connection.
VDD_IO	40	P		3.3V analog power supply.
ADDR_SEL	37	DI	Pull down	I^2C address select pin.
V1P2D	6	P		Internal regulated 1.2V digital power supply for digital core. This pin must not be used to power external devices.
VDD_PLL	2	P		Internal regulated 1.2V digital power supply for PLL. This pin must not be used to power external devices.
FAULT_B	12	DI	Pull up	Pull this pin low to turn off the PWM signal path.
LRCLK	8	DI	Pull down	Serial audio data left or right clock input.
SCLK	38	DI	Pull down	Serial audio data bit clock input.
SDIN	7	DI	Pull down	Serial audio data input.
SDA	10	DIO	Pull up	I^2C serial control data input or output.

SCL	11	DI	Pull up	I^2C serial clock input.
MONITOR_0	13	DO		Monitoring signal out from processor block / I^2S output.
MONITOR_1	14	DO		Monitoring signal out from processor block / I^2S output.
MONITOR_2	15	DO		Monitoring signal out from processor block / I^2S output.
RST_B	36	DI	Pull-up	Logic low to this pin to reset the system. When reset is pulled low, DAP restores to its default conditions, and places the PWM in the hard mute state.
TEST	4	DI	Pull down	Test pin.
AGND	25	P		Power Stage Analog ground.
PGND_A	34	P		Power ground for half-bridge A.
PGND_B	29	P		Power ground for half-bridge B.
PGND_C	22	P		Power ground for half-bridge C.
PGND_D	17	P		Power ground for half-bridge D.

Note: (1) Type: A =analog; D =digital; P =power/ground/decoupling; I =input; O =output; IO=inout
(2) All pull-ups and pull-downs are weak.

Absolute Maximum Ratings (Note 1)

VDD_IO, digital analog supply voltage ---------- -0.3V to 3.6V
PVDD, half-bridge supply voltage ---------- -0.3V to 30V
Input voltage, 3.3V digital input---------- -0.5V to (VDD_IO+0.5) V
VOUT_x ---------- 30V
GDREG ---------- -0.5V to 4V
VBS_x to VOUT_x ---------- -0.5V to 4V
Junction Temperature Range ---------- 0℃ to 150℃
Storage Temperature Range ---------- -40℃ to 125℃

Recommended Operating Conditions

VDD_IO, digital analog supply voltage ---------- 3.3V
PVDD, half-bridge supply voltage ---------- 4.5V to 28V
V_{IH}, High-level input voltage----------≥2V
V_{IL}, Low-level input voltage----------≤0.8V
$R_{L(BTL)}$, load impedance(BTL) ---------- 8Ω
$R_{L(PBTL)}$, load impedance(PBTL) ---------- 4Ω
Operating ambient Temperature Range ---------- 0℃ to 85℃
Operating Junction Temperature Range---------- 0℃ to 125℃

Note 1: Stresses beyond the above "Absolute Maximum Ratings" may cause permanent damage to the device. These are for stress ratings. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may remain possibility to affect device reliability.

PWM Operation at Recommended Operating Conditions

Parameter	Test Conditions	Value	Unit
Output Sample Rate	44.1kHz data rate	352.8	kHz
	32/48/96kHz data rate	384	

PLL Input Parameters and External Filter Components

Parameter	Test Conditions	Min	Typ	Max	Unit
F_{SCLK} SCLK Frequency		1.024		6.144	MHz
SCLK Duty Cycle		40%	50%	60%	
$tr/tf_{(SCLK)}$ SCLK Rise/Fall Time				5	ns

Detailed Description and Theory of Operation

Under Voltage Protection and Power on Reset

When power on, the Power on Reset circuit resets the overload circuit and ensures that all circuits are fully operational when PVDD and AVDD supply voltage reach 4.0V and 2.7V respectively. A voltage drops below the UVP threshold on AVDD or PVDD results in all half bridge outputs being set in the high impedance state, and the FAULT being set to low.

Clock, Auto Detection and PLL

This device is a slave only device. The digital audio processor supports all the sample rates and MCLK rates that are defined in the clock control register.

The DAP only supports a 1fs LRCLK. The clock section uses SCLK or the internal oscillator clock (when SCLK is unstable, out of range, or absent) to produce the internal clock running at 512 time of the PWM switching frequency.

The device has robust clock error handing that uses the built-in trimmed oscillator clock to quickly detect changes /errors. Once the system detects a clock change or error, it will mute the audio and then force PLL to limp using the internal oscillator as a reference clock. Once the clock is stable, the system will revert to normal operation. During this operation, the default volume will be restored in a single step (also called hard unmute). The ramp process can be programmed to ramp back slowly (also called soft unmute) as defined in volume register (0x06).

Serial Data Interface

Serial data is input on SDIN. The PWM outputs are derived from SDIN. The DAP accepts serial data in 16, 20, 18, or 24 bit left justified, right justified, and I^{2}S serial data formats.

PWM Section

The device PWM section accepts 24bit PCM data from DAP and output two BTL PWM audio output channels. The PWM section has an adjustable maximum modulation limit of 96.1% to 98.2%.

Serial Interface Control and Timing

The I^{2}S mode is set by writing to register 0x00.

I^{2}S Timing

I^{2}S uses LRCLK to define when the data being transmitted is for the left channel and when it is for the right channel. LRCLK is low for the left channel and high for the right channel. A clock running at 64fs is used to clock in data. There is a delay of one bit clock from the time the LRCLK changes state to the first bit of data on the data lines. The data is written MSB first and is valid on the rising edge of clock. The DAP masks unused trailing data bit positions.

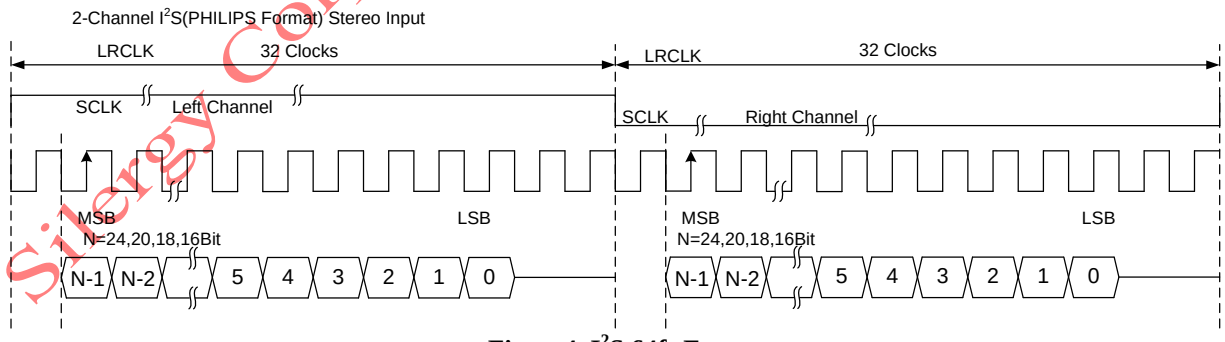

Figure4. I^{2}S 64fs Format

Left Justified

Left Justified (LJ) timing uses LRCLK to define when the data being transmitted is for the left channel and when it is for the right channel. LRCLK is high for the left channel and low for the right channel. A clock running at 64fs is used to clock in data. The first bit of data on the data lines at the same time LRCLK toggles. The data is written MSB first and is valid on the rising edge of clock. The DAP masks unused trailing data bit positions.

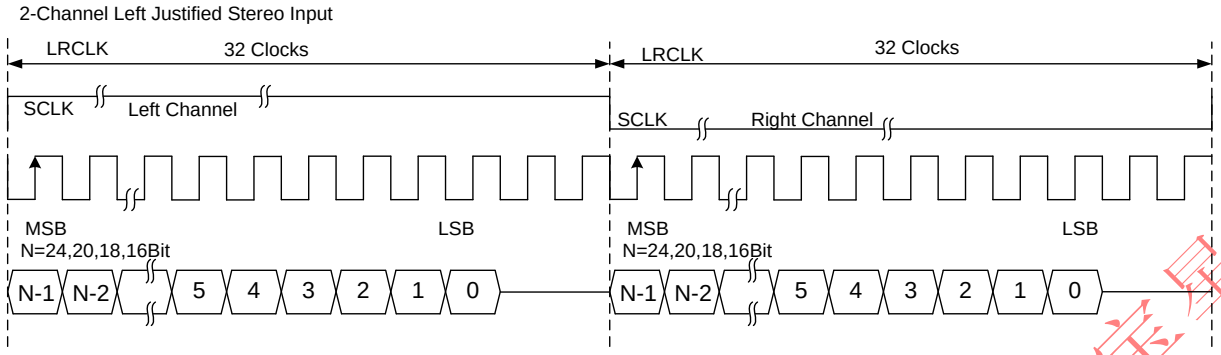

Figure5. Left Justified 64f$_S$ Format

Right Justified

Right Justified (RJ) timing uses LRCLK to define when the data being transmitted is for the left channel and when it is for the right channel. LRCLK is high for the left channel and low for the right channel. A clock running at 64fs is used to clock in data. The first bit of data on the data 8bit clock periods after LRCLK toggles. The data is written MSB first and is valid on the rising edge of clock. The DAP masks unused trailing data bit positions.

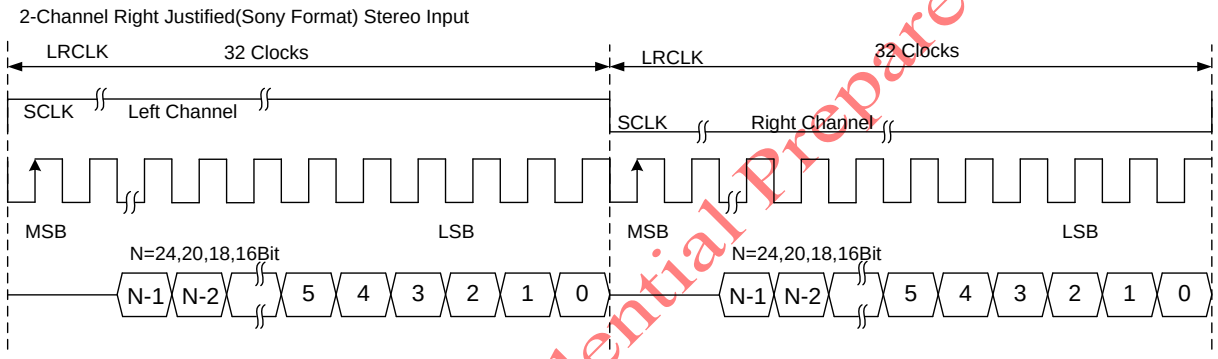

Figure6. Right Justified 64f$_S$ Format

DSP Mode

PCM mode supports mono and stereo formats, LRCLK polarity control and BCLK delay for start of data word.

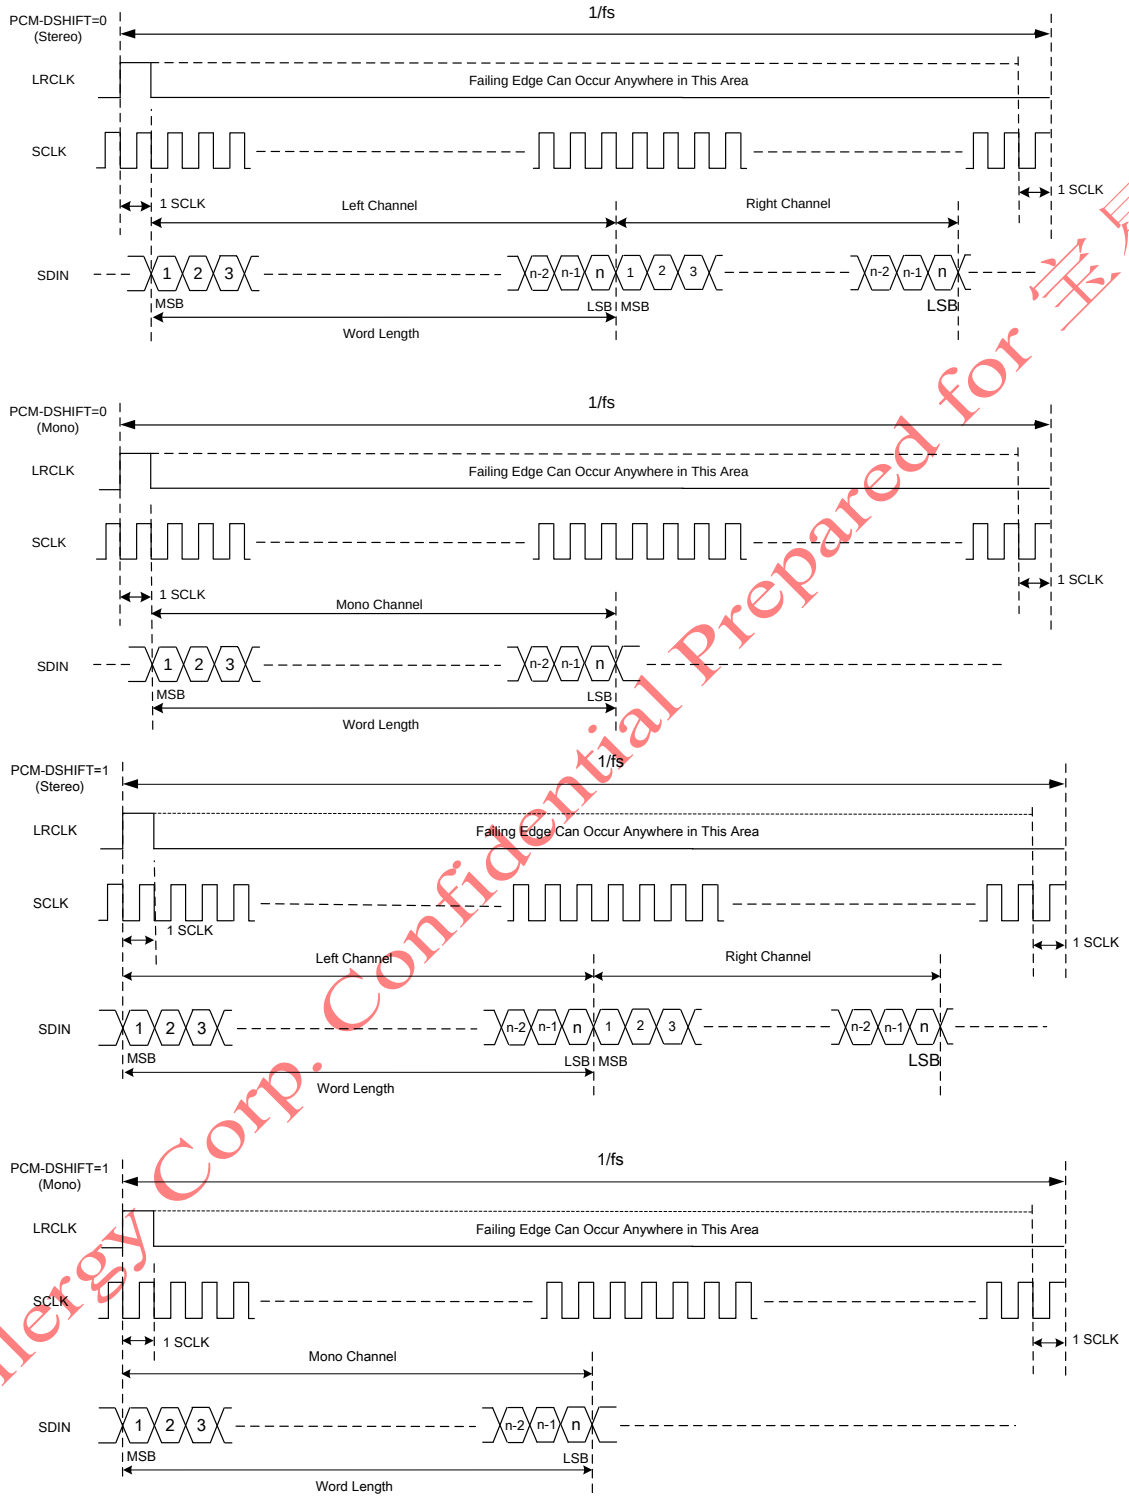

Figure7. DSP Format

I²C Serial Control Interface

The device DAP has a bidirectional I²C interface that compatible with the I²C bus protocol and supports both 100kHz and 400kHz data transfer rates for single and multiple byte write and read operations. The device does not support a multi-master bus or wait state insertion. The I²C control is used to program the registers of the device and to read device status. The device performs all I²C operations without I²C wait cycles.

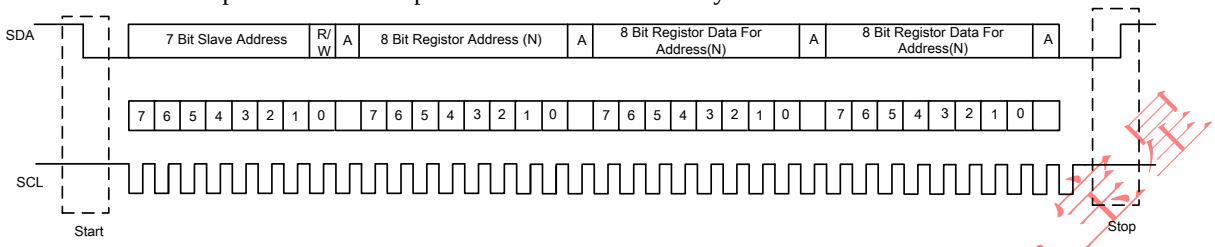

Figure8. Typical I²C Sequence

The ADDR_SEL pin defines the I²C device address. An 15kΩ resistor pull down on this pin gives this device address of 0x54 and a 15kΩ resistor pull up gives this device address 0x56.

I²C Device Address Change Procedure

Write to device address change enable register, 0xF8 with value of 0xF9 A5 A5A5.
Write to device register 0xF9 with a value of 0x0000 00XX, where XX is the new address
Any write after that should use the new device address XX.

Single and Multiple Byte Transfers

The I²C serial control interface supports both single byte and multiple read/write operations for sub addresses 0x00 to 0x1F. However, for the addresses 0x20 to 0xFF, the serial control interface supports single byte or multiple byte read/write operations.

During multiple byte read operations, the DAP responds with data, a byte at a time, starting at the sub address assigned, as long as the master device continues to response with acknowledges. If a particular sub address does not contain 8*N bits, the unused bits are read as logic 0.

During multiple byte write operations, the DAP compares the number of bytes transmitted to the number of bytes that are required for each specific sub address. For example, if a write command is received for a biquad sub address, the DAP expects to receive five 32bit words. If fewer than five 32bit data words have been received when a stop command (or another start command) is received, the data received is discarded.

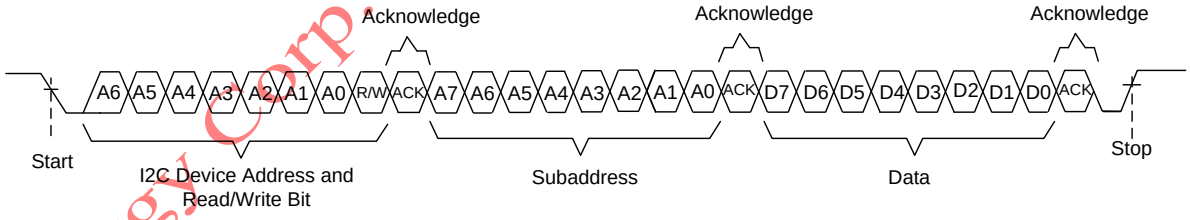

Figure9. Single Byte Write Transfer

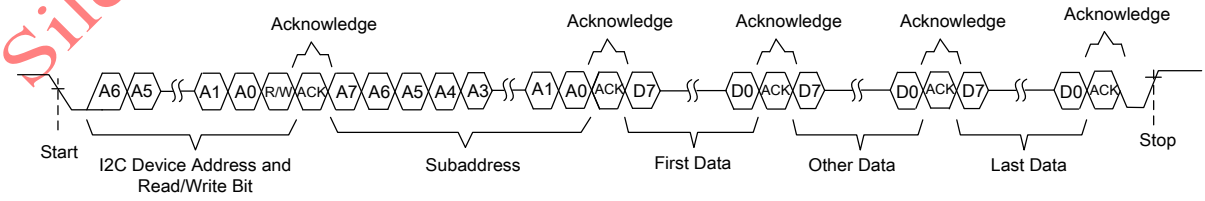

Figure10. Multiple-byte Write Transfer

Single Byte Write Transfer

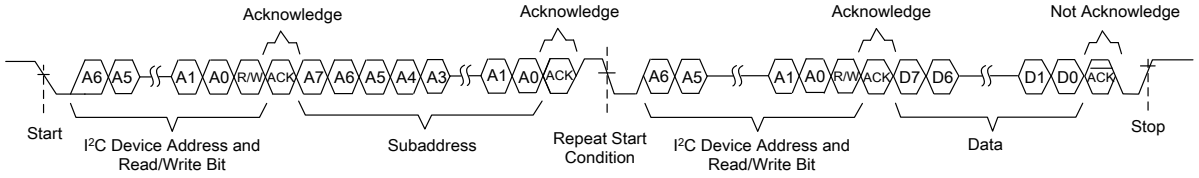

Figure11. Single Byte Read Transfer

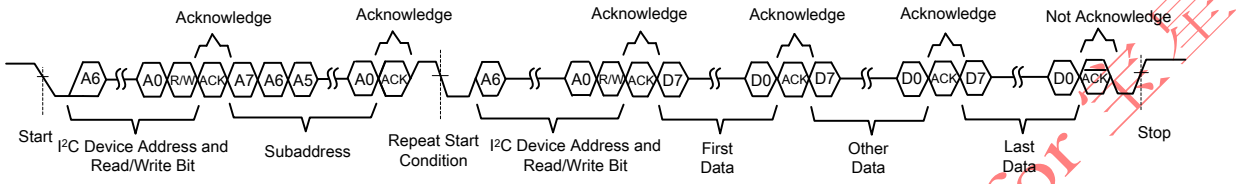

Figur12. Multiple-byte Read Transfer

SDATA Generator

The SDATA generator of SY6025 sends out I²S out signal. In order for SDATA out process to stably function, the falling of BCK should either synchronize or occur ahead of falling or rising of WCK.

SDATA Generator (Sdata out)	Register value of 0x17	Register value of 0x18	
	00H	0XH	X0H
	Sdata out => Monitor 0 pin	Sdata out => Monitor 1 pin	Sdata out => Monitor 2 pin

Table1. SDATA Generator Control

Output Mode and MUX Selection

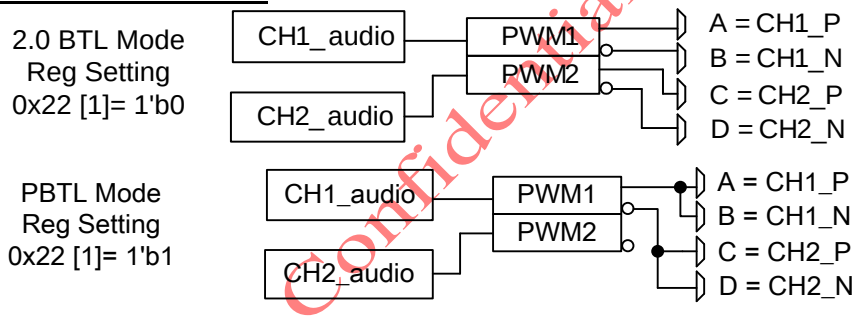

Figure13. Output Mode and MUX Selection

Single Filter PBTL Mode Support

The device supports parallel BTL mode with VOUT_A / VOUT_B (and VOUT_C / VOUT_D) connected before the LC filter. The 0x22[1] should be set 1'b1 to configure the PBTL mode. If an over current or short condition is detected in either half bridge, all of bridges will be turned off. In BTL mode, 0x22[1] should be set to 1'b0.

Mixer

The input channels can be mixed into each output channels with designated gains and polarity. Step size of mixer gain is variable according to the gain level as shown below.

Volume Range (dB)	Step (dB)
≤ -32	-∞
-6 ~ -32	1
+5.5 ~ -5.5	0.5
+18 ~ +6	1

Table2. Mixing Gain and Variable Step

4 mixing gain coefficients M11, M12, M21 and M22 are defined as shown in the equation below. Each Mxx stores volume value in dB scale, and the number values versus gain in dB are shown in table 2. By default, each input

channel connected to each output channel directly; M11 and M22 are set as 0 dB in plus polarity, M12 and M21 are set as -∞ dB.

[Output Channels] = [Mixer Matrix] × [Input Channels]

$$\begin{bmatrix} CH1OUT \\ CH2OUT \end{bmatrix} = \begin{bmatrix} M11 & M12 \\ M21 & M22 \end{bmatrix} \bullet \begin{bmatrix} CH1IN \\ CH2IN \end{bmatrix}$$

Table3. Serial Mixer Matrix

Refer to the register Address 0x5F in the Appendix.

Mixer Gain			
Index	dB	Index	dB

20	-3.5	00	mute

Table4. Mixer Gain

Pre-Processing

29 Bits 6.23 Number Format

All gain coefficients are 29bit coefficients using a 6.23 number format. 6.23 number format means that there are 6bits to the left of the decimal point and 23 bits to the right of the decimal point.

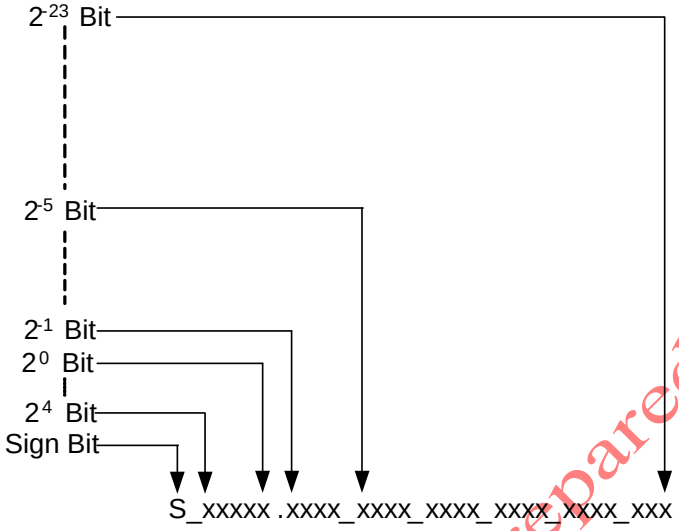

Figure14. 6.23 Number Format

If the most significant sign bit is logic 1, then the number is a negative number. Every bit must be inverted, then add 1 to the result, and then the weighting shown in Figure 21.

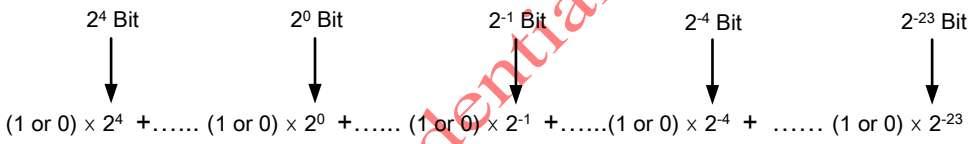

Figure15. Conversion weighting Factors—6.23 Format to Floating Point

Gain coefficients, entered via I^2C bus, must be entered as 32bits binary numbers. Bit[31:29] are zero padding.

BiQuad Structure

Each BiQuad has a 2nd IIR filter structure and has three coefficients on the direct path (b_0, b_1, b_2) and 2 coefficients on feedback path (a_1, a_2) as shown in the diagram.

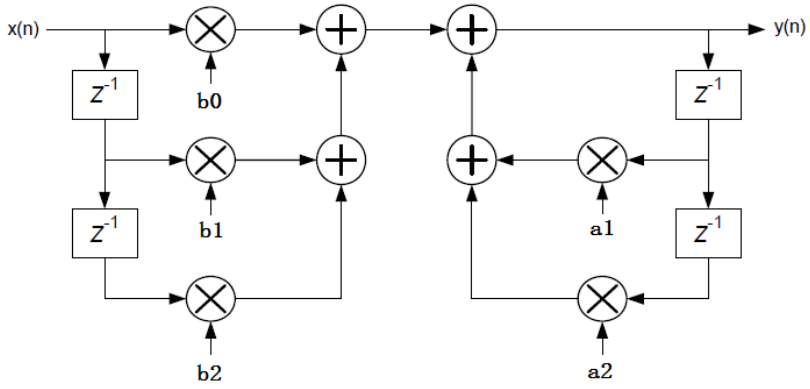

Figure16. Bi-quad Filter Structure

There are fourteen Bi-Quad filters linked serially in one channel. The Bi-Quad filters can be configured differently for each filter. The coefficients of BQn(n is from 0 to 13) are shared for both channel 1 and channel 2. BQn of channel 1 and channel 2 can be separately enabled or disabled. For example, BQ1 of channel 1 is enabled while BQ1 of channel 2 is disabled. As shown in Figure 23, first three filters can be configured as loudness control with loudness gain, and last four filters can be configured as SPEQ with SPEQ control.

The first BQ BQ0 must be enabled if enable loudness or prescale functionality by modifying the prescaler gain or loudness gain.

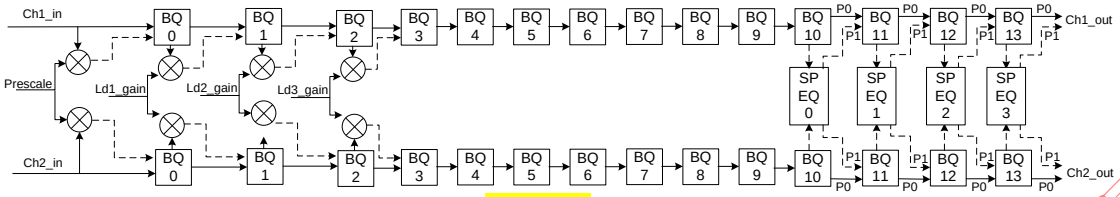

Figure17. Bi-quad Filter Chain

Filter coefficients are 29bit binary numbers and can be downloaded through I²C interface. Write actual coefficient values to 20 register addresses in the range from 0x30 to 0x4D to download Bi-Quad filter coefficients to SY6025. Refer to table 5. The amount of bytes for each register address is variable. For example, 20 bytes are for a BQ filter while 4 bytes are for the Pre-scaler.

The enable/disable operation of these Bi-Quad filters can be made by configuring the bits in register addresses of 0x25~0x2B. When BQn(n from 10 to 13) is configured as SPEQ or SPEQ Limit in register 0x2B, the BQn of both channels are functional as SPEQ or SPEQ Limit together, which can't be separately enabled or disabled for each channel. When BQn is configured as EQn, the EQn can be separately enabled or disabled for each channel.

I²C address	0x30	0x31	0x32	0x33	0x34

Table5. Address of Coefficients for Bi-Quad Filter Chain

Loudness Control

The frequency characteristics can be compensated in low volume level to fit the acoustic characteristics of human ears with Loudness control. The three coefficient of loudness can be downloaded through writing the 12 bytes of the register 0x4D. Four bytes are for one BQ loudness gain. The loudness gain values are shared for both channel 1 and channel 2.

The first BQ BQ0 must be enabled before enable loudness by setting bit 0 of register 0x03.

Register Address 0x4D	byte count 12	bits[95:64]	3'b000,ld3_gain[28:0]
		bits[63:32]	3'b000,ld2_gain[28:0]
		bits[31:0]	3'b000,ld1_gain[28:0]

Table6. Loudness Gain

Super Parametric Equalizer

The frequency characteristics based on input signal level can be compensated to fit the acoustic characteristics of human ears with SPEQ function.

There are a Bi-Quad filter coefficient and three additional coefficients for SPEQ. The three additional coefficients are related to gain and threshold. The Bi-Quad filter coefficient can be downloaded through writing 0x3B~0x3E. The three additional coefficients can be downloaded through writing the 12 bytes of the register 0x43~0x46. There are four bytes for one coefficient. The SPEQ coefficients are shared for both channel 1 and channel 2.

It can be configured as SPEQ Limit function as well. The frequency characteristics at some frequency point can't be limited to no more than the threshold with SPEQ Limit function. The way to download the coefficient is the same as SPEQ.

Volume & Dynamic Range Control

Volume Control

The volume register 0x07, 0x08, and 0x09 correspond to master volume, channel 1 volume, and channel 2 volume.

Master Volume Control

Master volume – 0x07 (default is mute, 0x00)

Step	Range
0.5 dB	0 ~ -126 dB

Table7. Master Volume Steps

Channel Volume Control

Channel-1 volume – 0x08 (default is 0 dB, 0x9F)

Channel-2 volume – 0x09 (default is 0 dB, 0x9F)

Step	Range
0.5 dB	+48 ~ -79 dB

Table8. Channel Volume Steps

Volume Fine Control and offset

Fine control for volume is +0.125dB step up to maximum +7.875dB boost. Step size is 0.125dB. It has high accurate step size and provides an offset gain for the channel volume and master volume.

Step	Range
0.125 dB	0 ~ +7.875 dB

Table9. Volume Fine Control Steps

Mute and Soft Volume Change

The chip enters mute state by setting soft mute flag of register Address 0x06. 0x06[3] is master mute flag for both left channel and right channel. 0x06[0] is individually mute flag for left channel while 0x06[1] is individually mute flag for right channel. With soft mute, the volume gradually increases or decreases when mute is turned off or on respectively.

Dynamic Range Control

The SY6025 features three multiband DRCs, as well as a full-band DRC, named post DRC. The multiband DRC is used as a three-band crossover, having an independent custom configuration for low, high, and mid frequency bands. Each band DRC has two dedicated BQs for frequency band crossover.

The DRC scheme has three DRC blocks. There is one ganged DRC for the high-band left/right channels, one DRC for the mid-band left/right channels, and one ganged DRC for the low-band left/right channels.

The function block diagram of multi-band DRC is shown as Figure 24.

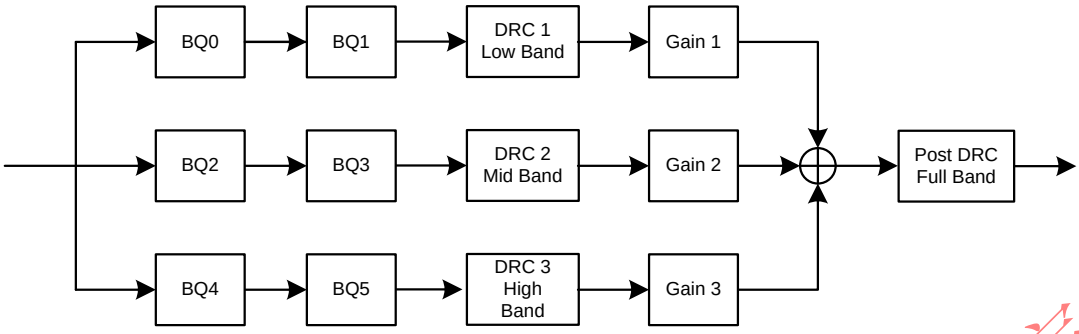

Figure18. Multi-bands DRC Structure

There are two dedicated BQs for each band, and the amplitude of each DRC output can be adjusted by corresponding gain control. The outputs of three bands DRC are merged and followed by post DRC which produces the output data with the fully controlled dynamic range. For detailed setting of the DRC registers, please refer to the system register addresses in Table 10.

I^2C address	0x47	0x48	0x49	0x4A	0x4B	0x4C
byte count	20	20	20	20	20	20
description	BQ1 of LDRC	BQ2 of LDRC	BQ1 of MDRC	BQ2 of MDRC	BQ1 of HDRC	BQ2 of HDRC

Table10. Coefficient Register Map for Dynamic Range Control

The DRC input/output diagram is shown in figure 25.

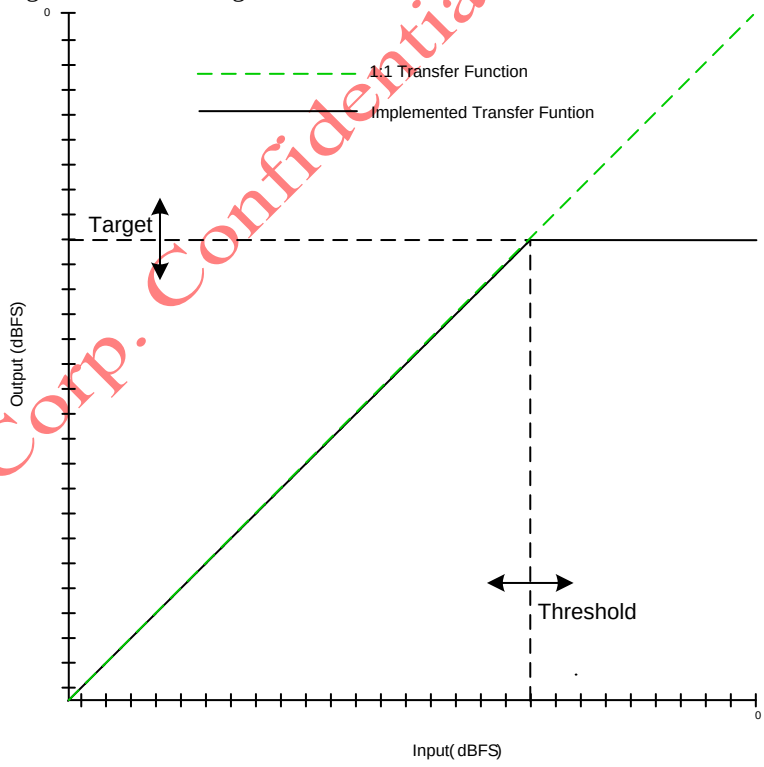

Figure19.Dynamic Range Control

Power Meter

The power meter measures signal's energy of internal, which can be used to study the power profile. It can be configured by sending value of energy through register address 0x57 and parts of 0x58. Read the 10bit value in dB through register address 0x58 while read the 23bit linear value through register address 0x59.

DC Protection

The system from outputting DC signal can cause a speaker unit burnt. The chip employs three sub functions to prevent DC output, which are dynamically calculating and monitoring the memory checksum, detecting PWM DC, and cutting DC component via two hard-wired filters. The hard-wired DC cut filter removes the DC component. The other two functionalities only report the error status, and external controller may reset the chip by writing register 0x0F to assert a soft reset.

Memory Checksum

While initializing the system, the checksum data of coefficients are downloaded from the external MCU from the address 0x5A to 0x5B. This memory checksum block compares the checksum data of current memory block and the checksum data at the initial time. If there is a discrepancy between two values due to some memory fault, the error flag bit 7 or/and bit 6 of address 0x07 is set to high. The external MCU can monitor these error flags and reset the chip by setting the DC soft reset to high at address 0x0F. This DC soft reset will initialize the whole chip, and initialization process of the memory should be done thereafter

PWM DC Detection

A PWM DC detector is employed. When there is a DC component in the output, it sets PWM DC error flag of address 0x02 to high. The external controller may monitor this error flag and reset the chip by writing register 0x0F to assert a soft reset. The threshold of PWM DC detection at address 0x19 can be set to decide the level of DC monitoring for both Ternary and BD mode.

Hard-wired DC Cut

Two hard-wired DC cut filters are employed, which can prevent the system from outputting the signal of less than 1Hz frequency.

Recommended Command Sequences

Initialization Sequence

1) Hold all digital inputs low and ramp up AVDD/DVDD to at least 3.3V.
2) Initialize digital inputs and PVDD supply as follows:
   - Drive RST_B = 0, and other digital inputs to their desired state while ensuring that all are never more than 2.5V above AVDD/DVDD. Wait at least 100µs, drive RST_B= 1, and wait at least another 13.5ms.
   - Ramp up PVDD to at least 4.5V while ensuring that it remains below 4V for at least 100µs after AVDD/DVDD reaches 3V. Then wait at least another 10µs.
3) Configure the DAP via I^2C
4) Configure remaining registers
5) Exit shutdown (sequence defined below).

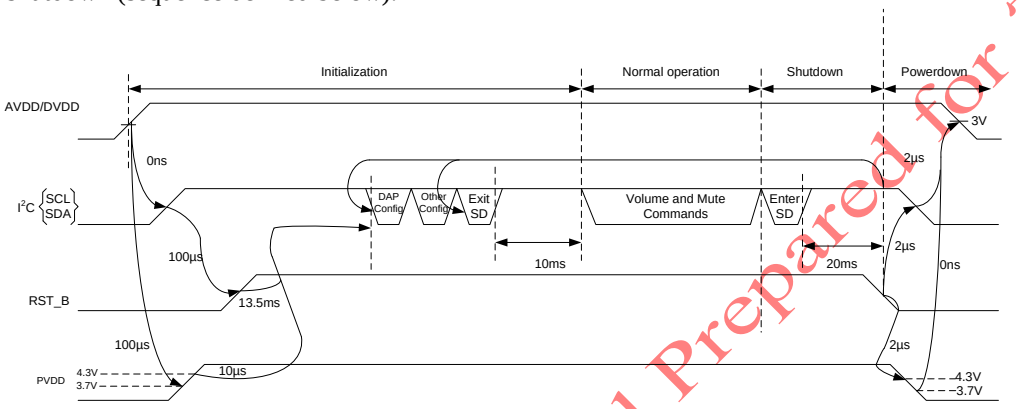

Figure20. Recommended Command Sequence

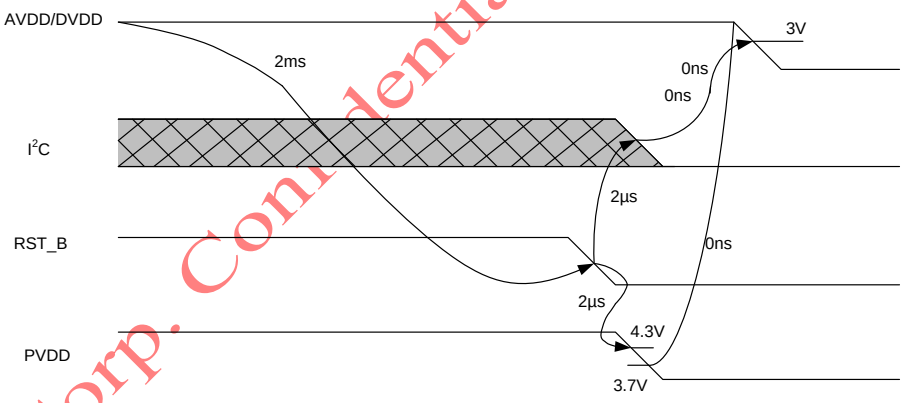

Figure21. Power Loss Sequence

Normal Operation

1) Write 0x00 or 0x01 to register 0x22.
2) Write to master/channel volume registers.
3) Write to soft mute registers.
4) Enter and exit shutdown (sequence defined below).

Shutdown Sequence

Enter:

1) Write 1'b1 to bit4 of register 0x22 to standby. Wait at least 10 ms
2) Write 1'b1 to bit5 of register 0x22 to shutdown.
3) Wait at least 20 ms
4) If desired, reconfigure by returning to step 4 of initialization sequence.

Exit:

1) Write1'b0 to bit5 of register 0x22.
2) Wait at least 10 ms.
3) Proceed with normal operation.

Appendix

Configuration Register Summary

Sub-address	Register name	Bytes	Contents	Initialization Value
			A u indicates unused bits.	
0x00	Clock Control Register	1	brt_sel, u[6:5],fs_cnfg_manual_en, fs_ rate_cnfg[1:0],fs_ rate_det[1:0]	0x1A
