4. To avoid output voltage is coupled to high during cold start, the slew rate of Vin should be less than 10 mV/μs

Setting Current Limit

FPF2895C current limit is set with an external resistor connected between I_{SET} and GND. This resistor is selected using the following equation:

$$R_{SET}(k\Omega) = \left(\frac{4674.89}{I_{SET}mA}\right)^{1/1.0326} \qquad \text{(eq. 1)}$$

Resistor tolerance of 1% or less is recommended. 5% tolerance can be achieved only when ILIM is set to larger than 2 A.
