

MIPI 2.0 SP8T switch for LTE diversity, Tx and LAA applications

Key Features

- 0.1 to 6 GHz coverage for LTE and LAA application
- LTE TX Power handling capabilities
- Ultra low insertion loss: 0.78dB at Band 42
- Small form factor 1.1mm x 1.9mm
- Fully compatible with MIPI 2.0 RFFE standard
- No decoupling capacitors required if no DC applied on RF lines

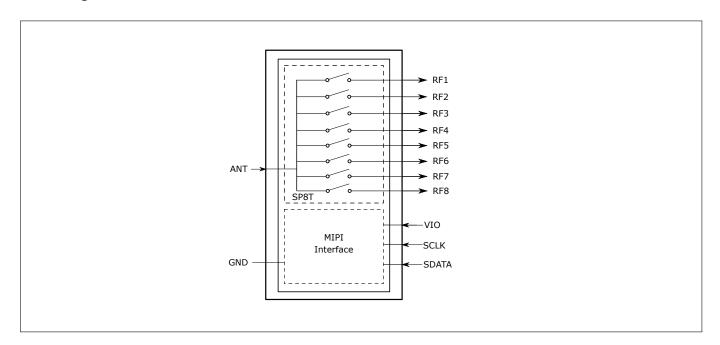

Applications

The SP8T switch is a band selection switch for LTE applications. With LTE TX power handling capability it is suitable for both LTE diversity path and LTE uplink Tx applications. The switch covers up to 6 GHz, so it supports Band 42, Band 43 and LAA.

Product Validation

Qualified for industrial applications according to the relevant tests of JEDEC47/20/22.

MIPI 2.0 SP8T switch for LTE diversity, Tx and LAA applications

Features

1 Features

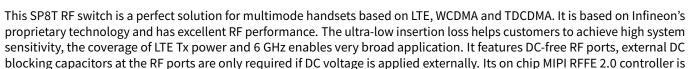

- 0.1 to 6 GHz coverage for LTE and LAA application
- Suitable for LTE / WCDMA / TDCDMA Applications
- LTE TX Power handling capabilities
- Ultra low insertion loss: 0.78dB at Band 42
- Small form factor 1.1mm x 1.9mm
- Fully compatible with MIPI 2.0 RFFE standard
- No decoupling capacitors required if no DC applied on RF lines
- Low harmonic generation
- High port-to-port-isolation
- On chip control logic including ESD protection
- No power supply blocking required
- High EMI robustness
- RoHS and WEEE compliant package

fully compatible with industry standard.

¹⁾ Switch has a low-pass response. For higher frequencies, losses have to be considered for their impact on thermal heating. The DC voltage at RF ports V_{RFDC} has to be OV.

Warning: Stresses above the max. values listed here may cause permanent damage to the device. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the integrated circuit. Exposure to conditions at or below absolute maximum rating but above the specified maximum operation conditions may affect device reliability and life time. Functionality of the device might not be given under these conditions.

²⁾ Note: Consider any ripple voltages on top of V_{IO} . Including RF ripple, V_{IO} must not exceed the maximum ratings: $V_{IO} = V_{DC} + V_{Ripple}$.

⁴⁾ Field-Induced Charged-Device Model ANSI/ESDA/JEDEC JS-002. Simulates charging/discharging events that occur in production equipment and processes. Potential for CDM ESD events occurs whenever there is metal-to-metal contact in manufacturing.
