## 2．6 Watt Mono Filter－Free Class－D Audio Power Amplifier

## Features

$\square$ Efficiency With an $8-\Omega$ Speaker：

$$
88 \% \text { at } 400 \mathrm{~mW}
$$

$80 \%$ at 100 mW
－ 3.8 mA Quiescent Current
－$\quad 0.4 \mu \mathrm{~A}$ Shutdown Current
$\square$ Optimized PWM Output Stage Eliminates LC Output Filter
$\square$ Internally Generated $250-\mathrm{kHz}$ Switching Frequency Eliminates Capacitor and Resistor
$\square$ Improved PSRR（ -75 dB ）and Wide Supply Voltage（2．5 V to 5.5 V ）Eliminates Need for a Voltage Regulator
－Fully Differential Design Reduces RF Rectification and Eliminates Bypass Capacitor
I Improved CMRR Eliminates Two Input Coupling Capacitors

## General Description

The BL6306 is a 2.6 W high efficiency filter－free class－D audio power amplifier that requires only three external components．

Features like $88 \%$ efficiency，-75 dB PSRR，and improved RF－rectification immunity make the BL6306 ideal for cellular handsets．In cellular handsets，the earpiece，speaker phone，and melody ringer can each be driven by the BL6306．

## Applications

$\square$ Mobile phone，PDA，MID
$\square$ MP3／4，PMP
－Portable electronic devices

## Test Circuit

Figure 5．BL6306 test set up circuit

Figure 6． $30-\mathrm{kHz}$ LPF for BL6306 test
Notes： $1>$ ． $\mathrm{C}_{\mathrm{S}}$ should be placed as close as possible to VDD／GND pad of the device
$2>$ ．Ci should be shorted for any Common－Mode input voltage measurement
$3>$ ．A 33 uH inductor should be used in series with $\mathrm{R}_{\mathrm{L}}$ for efficiency measurement
$4>$ ．The 30 kHz LPF（shown in figure 5 ）is required even if the analyzer has an internal LPF

## Component Recommended

Due to the weak noise immunity of the single－ended input application，the differential input application should be used whenever possible．The typical component values are listed in the table：

| $\mathrm{R}_{\mathrm{I}}$ | $\mathrm{C}_{\mathrm{I}}$ | $\mathrm{C}_{\mathrm{S}}$ |
| :---: | :---: | :---: |
| 150 k | 3.3 nF | 2 uF |

（1） $\mathrm{C}_{\mathrm{I}}$ should have a tolerance of $\pm 10 \%$ or better to reduce impedance mismatch．
（2）Use $1 \%$ tolerance resistors or better to keep the performance optimized，and place the $R_{I}$ close to the device to limit noise injection on the high－impedance nodes．

## Input Resistors（ $\mathbf{R}_{\mathrm{I}}$ ）\＆Capacitors（ $\mathbf{C}_{\mathrm{I}}$ ）

The input resistors $\left(\mathrm{R}_{\mathrm{I}}\right)$ set the total voltage gain of the amplifier according to Eq1

$$
\text { Gain }=\frac{2 \times 150 k \Omega}{R_{I}}\left(\frac{V}{V}\right) \quad E q 1
$$

The input resistor matching directly affects the CMRR，PSRR，and the second harmonic distortion cancellation．

If a differential signal source is used，and the signal is biased from $0.5 \mathrm{~V} \sim \mathrm{~V}_{\mathrm{DD}}-0.8 \mathrm{~V}$（shown in Figure2），the input capacitor $\left(\mathrm{C}_{\mathrm{I}}\right)$ is not required．

If the input signal is not biased within the recommended common－mode input range in differential input application（shown in Figure3），or in a single－ended input application（shown in Figure4），the input coupling capacitors are required．

If the input coupling capacitors are used，the $\mathrm{R}_{\mathrm{I}}$ and $\mathrm{C}_{\mathrm{I}}$ form a high－pass filter（HPF）．The corner frequency（ $\mathrm{f}_{\mathrm{c}}$ ）of the HPF can be calculated by $E q 2$

$$
f_{C}=\frac{1}{2 \pi \cdot R_{I} \cdot C_{I}}(H z) \quad E q 2
$$

## Decoupling Capacitor（ $\mathrm{C}_{\mathrm{s}}$ ）

A good low equivalent－series－resistance（ESR）ceramic capacitor（ $\mathrm{C}_{\mathrm{S}}$ ），used as power supply decoupling capacitor $\left(\mathrm{C}_{\mathrm{S}}\right)$ ，is required for high power supply rejection（PSRR），high efficiency and low total harmonic distortion（THD）． $\mathrm{C}_{\mathrm{S}}$ is $2 \mu \mathrm{~F}$ ，placed as close as possible to the device VDD pin．
