

## SN65DSI86 MIPI® DSI 至 eDP™ 桥

### 1 特性

- 嵌入式 DisplayPort™ (eDP™) 1.4 标准, 支持 1 条、2 条或 4 条信道在 1.62Gbps (RBR)、2.16Gbps、2.43Gbps、2.7Gbps (HBR)、3.24Gbps、4.32Gbps 或 5.4Gbps (HBR2) 速率下运行。
- 实现 MIPI® D-PHY 版本 1.1 物理层前端和显示串行接口 (DSI) 版本 1.02.00
- 双通道 DSI 接收器在每个通道上可针对 1 条, 2 条, 3 条或 4 条 D-PHY 数据信道进行配置, 每信道的运行速率高达 1.5Gbps
- 支持 RGB666 和 RGB888 格式的 18bpp 与 24bpp DSI 视频流
- 适合 60fps 4K 4096 × 2304 分辨率 (18bpp 颜色), 以及 60fps WUXGA 1920 × 1200 分辨率和 3D 图形显示 (120fps 等效)
- MIPI 前端可配置为单通道或双通道 DSI 配置
- 支持双通道 DSI 奇校验、偶校验、左移位和右移位操作模式
- 1.2V VCC 主电源, 1.8V 电源用于数字 I/O
- 低功耗特性包括面板刷新和 MIPI 超低功耗状态 (ULPS) 支持
- DisplayPort 信道极性和分配均可配置。
- 通过外部基准时钟 (REFCLK) 支持 12MHz、19.2MHz、26MHz、27MHz 和 38.4MHz 等频率
- ESD 额定值 ±4 kV (HBM)
- 采用 64 引脚 5mm x 5mm MicroStar Junior BGA (ZQE) 封装
- I<sup>2</sup>C 可配置
- 温度范围: -40°C 至 +85°C

### 2 应用

- 平板电脑、笔记本、上网本
- 移动互联网设备
- EPOS、便携式数据终端
- 测试和测量
- 工厂自动化与控制

### 3 说明

SN65DSI86 DSI 至嵌入式 DisplayPort (eDP) 桥 功能一个双通道 MIPI D-PHY 接收器前端配置, 此配置中在每个通道上具有 4 条信道, 每条信道的运行速率为 1.5Gbps, 最大输入带宽为 12Gbps。该桥接器可解码 MIPI DSI 18bpp RGB666 和 24bpp RGB888 视频流, 并将格式化视频数据流转换到具有多达四条信道的 DisplayPort, 每条信道的运行速率为 1.62Gbps、2.16 Gbps、2.43 Gbps、2.7Gbps、3.24Gbps、4.32Gbps 或 5.4Gbps。

SN65DSI86 非常适合每秒 60 帧的 WQXGA, 以及等效 120fps (高达 24bpp) 的 4K 和真正高清 (1920 × 1080) 分辨率 3D 图形。执行了部分线路缓冲以适应 DSI 与 DisplayPort 接口间的数据流不匹配。

器件信息<sup>(1)</sup>

器件型号	封装	封装尺寸 (标称值)
SN65DSI86	BGA MicroStar Junior (64)	5.00mm x 5.00mm

## 4 修订历史记录

注：之前版本的页码可能与当前版本有所不同。

Changes from Revision A (November 2015) to Revision B	Page
• 从数据表中删除了器件编号 SN65DSI96 .....	1
• 删除了特性“自适应内容管理和背光 PWM 控制...” .....	1
• 添加了特性：I2C 可配置 .....	1
• 更新了应用 列表 .....	1
• 更换了简单方框图 .....	1
• 将整个数据表中的 SN65DSIx6 更改成了 SN65DSI86 .....	4
• Deleted pagraph "For the SN65DSI96, the brightness is controlled.." from the <i>Pulse Width Modulation (PWM)</i> section ...	18
• Deleted the <i>PWM Backlight Selection Options</i> table .....	18
• Deleted the Assertive Display (SN65DSI96 Only) section .....	18
• Deleted step: "Configure Assertive Display Core. (For SN65DSI96 only)" from the <i>Power-Up Sequence</i> section .....	19
• Deleted step: "For SN65DSI96, disable Assertive Display core by clearing the ADEN bit." from the <i>Power Down Sequence</i> section .....	20
• Changed <a href="#">Figure 19</a> .....	42
• Deleted SN65DSI96 from address 0x00 through 0x07 of <a href="#">Table 19</a> .....	42
• Deleted address 0x3F from the <a href="#">Table 22</a> .....	46
• Deleted "This register is also used for SN65DSI96 when OPTION_SELECT is not equal to zero." from address 0xA3 in <a href="#">Table 27</a> .....	53
• Deleted "This register is also used for SN65DSI96 when OPTION_SELECT is not equal to zero." from address 0xA4 in <a href="#">Table 27</a> .....	53
• Changed 0xE6 Bits 7, 6, and 4 to Reserved in <a href="#">Table 30</a> .....	60
• Changed 0xE8 Bits 7 to Reserved in <a href="#">Table 30</a> .....	61
• Changed 0xF5 Bits 7, 6, and 4 to Reserved in <a href="#">Table 31</a> .....	64
• Changed 0xF7 Bits 7 to Reserved in <a href="#">Table 31</a> .....	64
• Deleted options 001 to 110 for 0xFF Bit 2:0 in <a href="#">Table 32</a> .....	65

<b>Changes from Original (September 2013) to Revision A</b>	<b>Page</b>
• 已添加 引脚配置和功能部分, ESD 额定值表, 特性说明部分, 器件功能模式, 应用和实施部分, 电源相关建议部分, 布局部分, 器件和文档支持部分以及机械、封装和可订购信息部分 .....	1
• Changed $R_{\theta JC(top)}$ MIN value in <i>Thermal Information</i> table from 32.9 to 32.1.....	7
• Added $R_{\theta JA}$ parameter to <i>Thermal Information</i> table .....	7
• Changed Description for ADDRESS 0x5A BIT(S) 1:0 from 'Reserved' to 'ASSR_CONTROL' with Bit assignments of 00, 01, 10, and 11 in <a href="#">Table 23</a> . .....	48
• Added <a href="#">Table 33</a> in Standard CFR Registers .....	65

---

## 5 说明 (续)

SN65DSI86 采用符合工业标准的接口技术设计，能够与多种微处理器兼容，并具有多种电源管理功能，包括面板刷新支持和 MIPI 定义的超低功耗状态 (ULPS) 支持。

SN65DSI86 采用小外形 5mm × 5mm MicroStar Junior 球栅阵列 (BGA) (间距 0.5mm) 封装，工作温度范围为 -40°C 到 +85°C。

本文档后续部分的 SN65DSI86 是指 SN65DSI86。因此，不论何时使用 SN65DSI86，此特定语句或特性仅涉及相应指定部件。

## 6 Pin Configuration and Functions

ZQE Package  
64-Pin BGA MicroStar Junior  
Top View

See [Layout Guidelines](#) for additional information.

### Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
ADDR	A1	CMOS Input/Output	Local I <sup>2</sup> C interface target address select. See <a href="#">Table 4</a> . In normal operation, this pin is an input. When the ADDR pin is programmed high, it must be tied to the same 1.8-V power rails where the SN65DSI86 VCCIO 1.8-V power rail is connected.
AUXP/N	H8, H9	LVDS I/O	Auxiliary-channel differential pair
DA0P/N	H3, J3	LVDS Input (HS) CMOS Input/Output (LS)	MIPI D-PHY channel A data lane 0; data rate up to 1.5 Gbps.
DA1P/N	H4, J4	LVDS Input (HS) CMOS Input (LS) (Failsafe)	MIPI D-PHY channel a data lane 1; data rate up to 1.5 Gbps.
DA2P/N	H6, J6	LVDS Input (HS) CMOS Input (LS) (Failsafe)	MIPI D-PHY channel A data lane 2; data rate up to 1.5 Gbps
DA3P/N	H7, J7	LVDS Input (HS) CMOS Input (LS) (Failsafe)	MIPI D-PHY channel A data lane 3; data rate up to 1.5 Gbps.
DACP/N	H5, J5	LVDS Input (HS) CMOS Input (LS) (Failsafe)	MIPI D-PHY channel A clock lane; operates up to 750 MHz. Under proper conditions, this clock can be used instead of REFCLK to feed DisplayPort PLL.
DB0P/N	C2, C1	LVDS Input (HS) CMOS Input (LS) (Failsafe)	MIPI D-PHY channel B data lane 0; data rate up to 1.5 Gbps.
DB1P/N	D2, D1	LVDS Input (HS) CMOS Input (LS) (Failsafe)	MIPI D-PHY channel B data lane 1; data rate up to 1.5 Gbps.
DB2P/N	F2, F1	LVDS Input (HS) CMOS Input (LS) (Failsafe)	MIPI D-PHY channel B data lane 2; data rate up to 1.5 Gbps.
DB3P/N	G2, G1	LVDS Input (HS) CMOS Input (LS) (Failsafe)	MIPI D-PHY channel B data lane 3; data rate up to 1.5 Gbps.
DBCP/N	E2, E1	LVDS Input (HS) CMOS Input (LS) (Failsafe)	MIPI D-PHY channel B clock lane; operates up to 750 MHz.
EN	B1	CMOS Input (Failsafe)	Chip enable and reset. Device is reset (shutdown) when EN is low. Deassertion (low) of EN will cause all internal CSRs and functions to be reset to default state.
GND	A8, D8, E4, E5, F4, F5, F6, G8	Power Supply	Reference ground for digital and analog circuits.
GPIO[4:1]	B4, A6, A5, A4	CMOS Input/Output	General-purpose I/O. See <a href="#">General-Purpose Input and Outputs</a> section for details on GPIO functionality. When these pins are set high, tie the pins to the same 1.8-V power rail that the SN65DSI86 VCCIO 1.8-V power rail is connected to.
HPD	J8	CMOS Input with internal pulldown. (Failsafe)	HPD input. This input requires a 51-kΩ 1% series resistor.
IRQ	A3	CMOS Output	Interrupt signal
ML0P/N	F8, F9	LVDS output (DP)	DisplayPort lane 0 transmit differential pair. Supports 1.62 Gbps, 2.16 Gbps, 2.43 Gbps, 2.7 Gbps, 3.24 Gbps, 4.32 Gbps, and 5.4 Gbps. All DisplayPort lanes transmit at the same data rate.
ML1P/N	E8, E9	LVDS output (DP)	DisplayPort lane 1 transmit differential pair. Supports 1.62 Gbps, 2.16 Gbps, 2.43 Gbps, 2.7 Gbps, 3.24 Gbps, 4.32 Gbps, and 5.4 Gbps. All DisplayPort lanes transmit at the same data rate.

**Pin Functions (continued)**

PIN		I/O	DESCRIPTION
NAME	NO.		
ML2P/N	C8, C9	LVDS output (DP)	DisplayPort lane 2 transmit differential pair. Supports 1.62 Gbps, 2.16 Gbps, 2.43 Gbps, 2.7 Gbps, 3.24 Gbps, 4.32 Gbps, and 5.4 Gbps. All DisplayPort lanes transmit at the same data rate.
ML3P/N	B8, B9	LVDS output (DP)	DisplayPort lane 3 transmit differential pair. Supports 1.62 Gbps, 2.16 Gbps, 2.43 Gbps, 2.7 Gbps, 3.24 Gbps, 4.32 Gbps, and 5.4 Gbps. All DisplayPort lanes transmit at the same data rate.
REFCLK	A7	Input	Reference clock. Frequency determined by value programmed in I <sup>2</sup> C register or value of GPIO[3:1] latched at rising edge of EN. Supported frequencies are: 12 MHz, 19.2 MHz, 26 MHz, 27 MHz, and 38.4 MHz. This pin must be tied to GND when DACP/N feeds the DisplayPort PLL
SCL	H1	OpenDrain Input/Output (Failsafe)	Local I <sup>2</sup> C interface clock.
SDA	J1	OpenDrain Input/Output (Failsafe)	Local I <sup>2</sup> C interface bidirectional data signal.
TEST1	B3	CMOS Input with internal pulldown.	Used for Texas Instruments internal use only. This pin must be left unconnected or tied to ground.
TEST2	B5	CMOS Input/Output with internal pulldown	Used for internal test, HBR2 compliance eye, and symbol error rate measurement pattern. For normal operation, pull down this pin to GND or leave unconnected. See <a href="#">Table 15</a> for information on HBR2 compliance eye and symbol error rate measurement patterns.
TEST3	B7	NA	Used for Texas Instruments internal use only. This pin must be left unconnected or tied to GND through a 0.1- $\mu$ F capacitor.
VCC	D6, D5, J2, J9	Power Supply	1.2-V power supply for digital core
VCCA	A9, G9, E6, B2, H2	Power Supply	1.2-V power supply for analog circuits. AVCC and VCC can be applied simultaneously.
VCCIO	B6, A2	Power Supply	1.8-V power supply for Digital I/O
VPLL	D9	Power Supply	1.8-V power supply for DisplayPort PLL

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Supply voltage	V <sub>CCA</sub> , V <sub>CC</sub>	-0.3	1.3	V
	V <sub>CCIO</sub> , V <sub>PLL</sub>	-0.3	2.175	
Input voltage	All input terminals	-0.5	2.175	V
Operating temperature		-40	85	°C
Storage temperature, T <sub>stg</sub>		-65	105	°C

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under [Recommended Operating Conditions](#). Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 7.2 ESD Ratings

		VALUE	UNIT
V <sub>ESD</sub>	Electrostatic discharge		
	Human body model <sup>(1)</sup>	±4000	V
	Charged-device model <sup>(2)</sup>	±500	V

(1) Tested in accordance with JEDEC Standard 22, Test Method A114-B

(2) Tested in accordance with JEDEC Standard 22, Test Method C101-A

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V <sub>CCA</sub>	VCCA Power supply; analog circuits	1.14	1.2	1.26	V
V <sub>CC</sub>	VCC Power supply; digital circuits	1.14	1.2	1.26	V
V <sub>CCIO</sub>	VCCIO Power Supply; digital IOs.	1.65	1.8	1.98	V
V <sub>PLL</sub>	VPLL Power Supply, DisplayPort PLL	1.65	1.8	1.98	V
V <sub>PSN</sub>	Supply noise on any VCC terminal	f <sub>(noise)</sub> > 1 MHz		0.05	V
V <sub>DSI_PIN</sub>	DSI input pin voltage range	-50		1350	mV
f <sub>(I2C)</sub>	Local I <sup>2</sup> C input frequency			400	kHz
f <sub>HS_CLK</sub>	DSI HS clock input frequency	40		750	MHz
Z <sub>L</sub>	DP output differential load impedance	90		110	Ω
T <sub>A</sub>	Operating free-air temperature	-40		85	°C
T <sub>J</sub>	Operating junction temperature	-40		105	°C

### 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		SN65DSI86		UNIT
		ZQE (BGA MICROSTAR JUNIOR)		
		64 PINS		
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	72.9		°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	32.1		°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	32.9		°C/W
ψ <sub>JT</sub>	Junction-to-top thermal resistance metric	High-K board	1.0	°C/W
ψ <sub>JB</sub>	Junction-to-board thermal resistance metric	High-K board	35.8	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	N/A		°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 7.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP <sup>(1)</sup>	MAX	UNIT
<b>STANDARD IO (TEST1, TEST2, ADDR, SCL, SDA, IRQ, REFCLK, EN, GPIO[4:1])</b>						
V <sub>IL</sub>	Low-level control signal input voltage				0.3 × V <sub>CCIO</sub>	V
V <sub>IH</sub>	High-level control signal input voltage		0.7 × V <sub>CCIO</sub>			V
V <sub>OH</sub>	High-level output voltage	I <sub>OH</sub> = −2 mA	1.3			V
V <sub>OL</sub>	Low-level output voltage	I <sub>OL</sub> = 2 mA			0.4	V
I <sub>IH</sub>	High-level input current	Any input terminal			±5	μA
I <sub>IL</sub>	Low-level input current					
I <sub>OZ</sub>	High-impedance output current	Any output terminal			±10	μA
I <sub>OS</sub>	Short-circuit output current	Any output driving GND short			±2	mA
I <sub>CCA</sub>	V <sub>CCA</sub> device active current	V <sub>CCA</sub> = 1.2 V <sup>(2)</sup>		70	126	mA
I <sub>CC</sub>	V <sub>CC</sub> device active current	V <sub>CCA</sub> = 1.2 V <sup>(2)</sup>		43	52	mA
I <sub>CCIO</sub>	V <sub>CCIO</sub> and V <sub>PLL</sub> device active current	V <sub>CCIO</sub> = 1.8 V, V <sub>PLL</sub> = 1.8 V <sup>(2)</sup>		32	32	mA
I <sub>SUSPEND_CCA</sub>	V <sub>CCA</sub> device suspend current	All data and clock lanes are in ultra-low power state (ULPS) and SUSPEND = 1		9.8		mA
I <sub>SUSPEND_CC</sub>	V <sub>CC</sub> device suspend current	All data and clock lanes are in ultra-low power state (ULPS) and SUSPEND = 1		9		mA
I <sub>SUSPEND_CCIO</sub>	V <sub>CCIO</sub> and V <sub>PLL</sub> device suspend current	All data and clock lanes are in ultra-low power state (ULPS) and SUSPEND = 1		1.16		mA
I <sub>EN_CCA</sub>	V <sub>CCA</sub> shutdown current	EN = 0		0.95		mA
I <sub>EN_CC</sub>	V <sub>CC</sub> shutdown current	EN = 0		2		mA
I <sub>EN_CCIO</sub>	V <sub>CCIO</sub> and V <sub>PLL</sub> shutdown current	EN = 0		0.038		mA
R <sub>EN</sub>	EN control input resistor			150		kΩ
<b>ADDR, EN, SCL, SDA, DBP/N[3:0], DAP/N[3:1], DBCP/N, DACP/N</b>						
I <sub>LEAK</sub>	Input failsafe leakage current	V <sub>CC</sub> = 0; V <sub>CCIO</sub> = 0 V. Input pulled up to V <sub>CCIO</sub> max. DSI inputs pulled up to 1.3 V	−40		40	μA
<b>MIPI DSI INTERFACE</b>						
V <sub>IH-LP</sub>	LP receiver input high threshold	See <a href="#">Figure 5</a>	880		550	mV
V <sub>IL-LP</sub>	LP receiver input low threshold					
V <sub>OH-LP</sub>	LP transmitter high-level output voltage		1100		1300	mV
V <sub>OL-LP</sub>	LP transmitter low-level output voltage		−50		50	mV
V <sub>IHCD</sub>	LP Logic 1 contention threshold		450			mV
V <sub>ILCD</sub>	LP Logic 0 contention threshold				200	mV
V <sub>ID</sub>	HS differential input voltage		70		270	mV
V <sub>IDT</sub>	HS differential input voltage threshold				50	mV
V <sub>IL-ULPS</sub>	LP receiver input low threshold; ultra-low power state (ULPS)				300	mV
V <sub>CM-HS</sub>	HS common mode voltage; steady-state		70		330	mV
ΔV <sub>CM-HS</sub>	HS common mode peak-to-peak variation including symbol delta and interference				100	mV
V <sub>IH-HS</sub>	HS single-ended input high voltage	See <a href="#">Figure 5</a>	−40		460	mV
V <sub>IL-HS</sub>	HS single-ended input low voltage					

 (1) All typical values are at V<sub>CC</sub> = 1.2 V, V<sub>CCA</sub> = 1.2 V, V<sub>CCIO</sub> = 1.8 V, and V<sub>PLL</sub> = 1.8 V, and T<sub>A</sub> = 25°C

(2) Maximum condition: WQXGA 60 fps Dual-Link 2xDP at HBR2, PLL enabled; typical condition: WUXGA 60 fps 1xDP at HBR2, PLL enabled

## Electrical Characteristics (continued)

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP <sup>(1)</sup>	MAX	UNIT
V <sub>TERM-EN</sub>	HS termination enable; single-ended input voltage (both Dp AND Dn apply to enable)	Termination is switched simultaneous for Dn and Dp			450	mV
R <sub>DIFF-HS</sub>	HS mode differential input impedance		80		125	Ω
<b>DisplayPort MAIN LINK</b>						
V <sub>TX_DC_CM</sub>	Output common mode voltage		0		2	V
V <sub>TX_AC_CM_HBR_RBR</sub>	TX AC common mode voltage for HBR and RBR.				20	mVRMS
V <sub>TX_AC_CM_HBR2</sub>	TX AC common mode voltage for HBR2				30	mVRMS
V <sub>TX_DIFFPP_LVL0</sub>	Differential peak-to-peak output voltage level 0	Based on default state of V0_P0_VOD register	300	400	460	mV
V <sub>TX_DIFFPP_LVL1</sub>	Differential peak-to-peak output voltage level 1	Based on default state of V1_P0_VOD register	450	600	690	mV
V <sub>TX_DIFFPP_LVL2</sub>	Differential peak-to-peak output voltage level 2	Based on default state of V2_P0_VOD register	600	800	920	mV
V <sub>TX_DIFFPP_LVL3</sub>	Differential peak-to-peak output voltage level 3	Based on default state of V3_P0_VOD register. Level 3 is not enabled by default	600	800	920	mV
V <sub>TX_PRE_RATIO_0</sub>	Pre-emphasis level 0		0	0	0	dB
V <sub>TX_PRE_RATIO_1</sub>	Pre-emphasis level 1		2.8	3.5	4.2	dB
V <sub>TX_PRE_RATIO_2</sub>	Pre-emphasis level 2		4.8	6.0	7.2	dB
V <sub>TX_PRE_RATIO_3</sub>	Pre-emphasis level 3	Level 3 is not enabled by default	4.8	6.0	7.2	dB
V <sub>TX_PRE_POST2_RATIO_0</sub>	Post-cursor2 level 0		0	0	0	dB
V <sub>TX_PRE_POST2_RATIO_1</sub>	Post-cursor2 level 1		-1.1	-0.9	-0.7	dB
V <sub>TX_PRE_POST2_RATIO_2</sub>	Post-cursor2 level 2		-2.3	-1.9	-1.5	dB
V <sub>TX_PRE_POST2_RATIO_3</sub>	Post-cursor2 level 3	Level 3 is not enabled by default	-3.7	-3.1	-2.5	dB
I <sub>TX_SHORT</sub>	TX short circuit current limit				50	mA
R <sub>TX_DIFF</sub>	Differential impedance		80	100	120	Ω
C <sub>AC_COUPLING</sub>	AC coupling capacitor		75		200	nF
<b>DisplayPort HPD</b>						
V <sub>HPD_PLUG</sub>	Hot plug detection threshold	Measured at 51-kΩ series resistor.	2.2			V
V <sub>HPD_UNPLUG</sub>	Hot unplug detection threshold	Measured at 51-kΩ series resistor.			0.8	V
R <sub>HPDPD</sub>	HPD internal pulldown resistor		51	60	69	kΩ
<b>DisplayPort AUX INTERFACE</b>						
V <sub>AUX_DIFF_PP_TX</sub>	Peak-to-peak differential voltage at transmit pins	$V_{AUX\_DIFF\_PP} = 2 \times  V_{AUXP} - V_{AUXN} $	0.18		1.38	V
V <sub>AUX_DIFF_PP_RX</sub>	Peak-to-peak differential voltage at receive pins	$V_{AUX\_DIFF\_PP} = 2 \times  V_{AUXP} - V_{AUXN} $	0.18		1.36	V
R <sub>AUX_TERM</sub>	AUX channel termination DC resistance			100		Ω
V <sub>AUX_DC_CM</sub>	AUX channel DC common mode voltage		0		1.2	V
V <sub>AUX_TURN_CM</sub>	AUX channel turnaround common-mode voltage				0.3	V
I <sub>AUX_SHORT</sub>	AUX Channel short circuit current limit				90	mA
C <sub>AUX</sub>	AUX AC-coupling capacitor		75		200	nF

## 7.6 Timing Requirements

		MIN	MAX	UNIT
<b>Power-up For DPPLL_CLK_SRC = REFCLK, See Figure 1</b>				
td1	V <sub>CC/A</sub> stable before V <sub>CCIO</sub> /V <sub>PLL</sub> stable	0		μs
td2	V <sub>CC/A</sub> and V <sub>CCIO</sub> /V <sub>PLL</sub> stable before EN assertion	100		μs
td3	REFCLK active and stable before EN assertion	0		μs
td4	GPIO[3:1] stable before EN assertion	0		ns
td5	GPIO[3:1] stable after EN assertion	5		μs
td6	LP11 state on DSI channels A and B before EN assertion	0		ns

## 8 Detailed Description

### 8.1 Overview

The SN65DSI86 is a MIPI DSI to eDP bridge, and supports MIPI DSI RGB 18 bpp (loosely packed or tightly packed) and 24 bpp formats. The SN65DSI86 packetizes the 18-bpp or 24-bpp RGB data received on the DSI inputs and transmits over the eDP interface in SST format at data rates up to 5.4 Gbps. With support of up to eight DSI lanes at 1.5 Gbps per DSI lane, and four lanes of eDP at speeds up to 5.4 Gbps, the SN65DSI86 is perfectly suited for both standard high definition (HD) displays as well as ultra HD displays like 4K2K.

### 8.2 Functional Block Diagram

Copyright © 2017, Texas Instruments Incorporated

## 8.3 Feature Description

### 8.3.1 MIPI Dual DSI Interface

The SN65DSI86 supports two 4-lane MIPI DSI inputs called DSIA and DSIB. Each lane supports a data rate up to 1.5 Gbps and can accept 18 bpp or 24 bpp RGB data. When only using the DSIA channel, the SN65DSI86 can support an maximum video stream rate of 6 Gbps that easily supports HD resolutions. If larger resolutions like 4K2K are required, the maximum stream rate can be increased to 12 Gbps by using both DSIA and DSIB channels. When using both DSIA and DSIB channels, the SN65DSI86 requires the pixels on each active line to be broken up into either odd pixels on DSIA and even pixels on DSIB, or left half of line on DSIA and right half of line on DSIB.

The SN65DSI86 also supports DSI generic read and write operation. Using DSI generic reads and writes, the external GPU can configure the SN65DSI86 internal registers and communicate with eDP panels. The DSI generic read and writes is also used for panel self refresh (PSR). In order to use the PSR feature, the eDP panel must support PSR and the GPU must support generating generic reads and writes without stopping the video stream. Generic reads and writes must be performed during video blanking time in order for PSR to work properly.

### 8.3.2 Embedded DisplayPort Interface

The SN65DSI86 supports Single-Stream Transport (SST) mode over one, two, or 4 lanes at data rates of 1.62 Gbps (RBR), 2.16 Gbps, 2.43 Gbps, 2.7 Gbps (HBR), 3.24 Gbps, 4.32 Gbps, and 5.4 Gbps (HBR2). All lanes operate at the same rate (SN65DSI86 does not support each lane being at a different data rate). The SN65DSI86 allows for software control of the eDP interfaces voltage swing level, pre-emphasis level, and SSC. Because the SN65DSI86 is a DSI to eDP bridge, the SN65DSI86 only supports eDP panels which support ASSR (Alternate Scrambler Seed Reset). Software must either through the DSI interface or I<sup>2</sup>C interface enable ASSR in the eDP panel before attempting to link train. See the [Example Script](#) section on how to enable ASSR in the eDP panel.

### 8.3.3 General-Purpose Input and Outputs

The SN65DSI86 provides four GPIO pins that can be configured as an input or output. The GPIOs default to input but can be changed to output by changing the appropriate GPIO register.

GPIO Functions:

1. Input
2. Output
3. SUSPEND Input (powers down entire chip except for I<sup>2</sup>C interface)
4. PWM
5. DSIA VSYNC
6. DSIA HSYNC

#### 8.3.3.1 GPIO REFCLK and DSIA Clock Selection

The clock source for the SN65DSI86 is derived from one of two sources: REFCLK pin or DACP/N pins. On the rising edge of EN, the sampled state of GPIO[3:1] as well as the detection of a clock on REFCLK pin is used to determine the clock source and the frequency of that clock. After the EN, software through the I<sup>2</sup>C interface can change the configuration of REFCLK\_FREQ, and CHA\_DSI\_CLK\_RANGE registers for the case where GPIO[3:1] sampled state does not represent the intended functionality. Because the clock source is determined at the assertion of EN, software can not change the clock source. See [Table 1](#) for GPIO to REFCLK or DACP/N frequency combinations.

**Feature Description (continued)**
**Table 1. GPIO REFCLK or DACP/N Frequency Selection<sup>(1)(2)(3)</sup>**

GPIO[3:1]	REFCLK FREQUENCY (DPPLL_CLK_SRC = 0)	DACP/N CLOCK FREQUENCY (DPPLL_CLK_SRC = 1)	REFCLK_FREQ
3'b000	12 MHz	468 MHz (DSIACLK / 39 = 12 MHz )	0x0
3'b001	19.2 MHz	384 MHz (DSIACLK / 20 = 19.2 MHz)	0x1
3'b010	26 MHz	416 MHz (DSIACLK / 16 = 26 MHz)	0x2
3'b011	27 MHz	486 MHz (DSIACLK / 18 = 27 MHz)	0x3
3'b100	38.4 MHz	460.8 MHz (DSIACLK / 12 = 38.4 MHz)	0x4
3'b101 through 3'b111	19.2 MHz	384 MHz (DSIACLK / 20 = 19.2 MHz)	0x5 through 0x7

- (1) For case when DPPLL\_CLK\_SRC = 1, the SN65DSI86 will update the CHA\_DSI\_CLK\_RANGE and CHB\_DSI\_CLK\_RANGE with a value that represents the selected DSI clock frequency. Software can change this value.
- (2) REFCLK pin must be tied or pull-down to GND when the DACP/N is used as the clock source for the DPPLL.
- (3) If GPIO selection of REFCLK or DACP/N frequency is not used, then software must program the REFCLK\_FREQ, CHA\_DSI\_CLK\_RANGE and CHB\_DSI\_CLK\_RANGE through the I<sup>2</sup>C interface prior to issuing any DSI commands or packets to the SN65DSI86.

**8.3.3.2 Suspend Mode**

Suspend mode is intended to be used with the [Panel Self Refresh \(PSR\)](#) feature of the eDP sink. The PSR feature saves system power but this power savings must not produce any noticeable display artifacts to the end user. The deassertion of EN produces the greatest DSIX6 power savings, but the reconfiguration of the DSIX6 may be too slow, and therefore produce a bad end-user experience. In this case, Suspend mode is the next best option for reducing DSIX6 power consumption while in an active PSR state. Suspend mode allows for quick exit from an active PSR state.

When GPIO1 is configured for suspended operation (GPIO1 pin is asserted), then the DSIX6 is placed in low-power mode. The suspend (GPIO1) pin is sampled by the rising edge of REFCLK. If the suspend pin is sampled asserted, then all CSR registers do not reset to the default values, and the DP PLL, DP interface, and DSI interfaces are powered off, as shown in [Figure 3](#). REFCLK can be turned off when DSIX6 is in Suspend mode. [Timing Requirements](#) summarizes the timing requirements to take the DSIX6 into Suspend mode.

The DSIX6 supports assertion of IRQ for HPD events. When an IRQ\_HPDP event is detected and both IRQ\_EN and IRQ\_HPDP\_EN bits are set, then the DSIX6 will assert the IRQ.

In order to take the DSIX6 out of Suspend mode, the REFCLK must be running before and after the suspend (GPIO1) pin is deasserted. After the DP PLL is locked, the DSIX6 transitions the ML\_TX\_MODE from Main Link Off to either Normal or Semi-Auto Link depending on the state of PSR\_TRAIN register. If the PSR\_EXIT\_VIDEO bit is set, then active video begins transmitting over the DisplayPort interface after the first vertical sync start (VSS) is detected on the DSI interface. If the PSR\_EXIT\_VIDEO bit is not set, software must enable the VSTREAM\_ENABLE bit. Then active video begins transmitting over the DisplayPort interface after the first vertical sync start. The [Timing Requirements](#) table summarizes the timing requirements to take the DSIX6 into SUSPEND mode. (VSS) is detected on the DSI interface.

---

**NOTE**

If the GPIO4\_CTRL is configured for PWM, the PWM will be active during SUSPEND. If the system designer does not wish the PWM active during SUSPEND, then software can change the GPIO4\_CTRL to Input before entering SUSPEND and then re-enable PWM after exiting SUSPEND by changing the GPIO4\_CTRL to PWM.

---

---

**NOTE**

For the case when DPPLL\_CLK\_SRC = 1, REFCLK mentioned in this section is replaced with a divided down version of the DSIA\_CLK (DCAP/N). The means that DSIA\_CLK must be active before the assertion of SUSPEND and before the deassertion of SUSPEND as specified in [Timing Requirements](#). The DSIA\_CLK can be stopped while in SUSPEND as long as above requirements are met.

---

### 8.3.3.3 Pulse Width Modulation (PWM)

The SN65DSI86 supports controlling the brightness of eDP display via pulse width modulation. The PWM signal is output over GPIO4 when GPIO4 control register is configured for PWM. For the SN65DSI86, the brightness is controlled by the BACKLIGHT register.

The granularity of brightness is controlled directly by the 16-bit BACKLIGHT\_SCALE register. This register allows a granularity of up to 65535 increments. This register, in combination with either the BACKLIGHT register, will determine the duty cycle of the PWM. For example, if the BACKLIGHT\_SCALE register is programmed to 0xFF and the BACKLIGHT is programmed to 0x40, then the duty cycle will be 25% (25% of the PWM period will be high and 75% of the PWM period will be low). The duty cycle would be 100% (PWM always HIGH) if the BACKLIGHT register was programmed to 0xFF and would be 0% (PWM always low) if BACKLIGHT register was programmed to 0x00. The BACKLIGHT\_SCALE should be set equal to the digital value corresponding to the maximum possible backlight brightness that the display can produce. For example, if the backlight level is 16-bit, then BACKLIGHT\_SCALE should be 0xFFFF, if it is an 8-bit range, then BACKLIGHT\_SCALE should be set to 0x00FF.

Duty Cycle (high pulse) = (BACKLIGHT) / (BACKLIGHT\_SCALE + 1)

The frequency of the PWM is determined by the REFCLK\_FREQ register and the value programmed into both the PWM\_PRE\_DIV and BACKLIGHT\_SCALE registers. The equation below determines the PWM frequency:

$$\text{PWM FREQ} = \text{REFCLK\_FREQ} / (\text{PWM\_PRE\_DIV} \times \text{BACKLIGHT\_SCALE} + 1)$$

Regardless of the state of the DPPLL\_CLK\_SRC register, the REFCLK\_FREQ value in above equation will be based on the frequencies of DPPLL\_CLK\_SRC equal 0 (12 MHz, 19.2 MHz, 26 MHz, 27 MHz, 38.4 MHz). The REFCLK\_FREQ will not be the DSIA CLK frequency in the case where DPPLL\_CLK\_SRC equals one.

---

#### NOTE

REFCLK or DACP/N must be running if GPIO4 is configured for PWM.

---

## 8.4 Device Functional Modes

### 8.4.1 Reset Implementation

When EN is deasserted, CMOS inputs are ignored, the MIPI D-PHY inputs are disabled, and outputs are high impedance. It is critical to transition the EN input from a low to a high level after the  $V_{CC}$  supply has reached the minimum recommended operating voltage. This is achieved by a control signal to the EN input, or by an external capacitor connected between EN and GND. To insure that the SN65DSI86 is properly reset, the EN pin must be deasserted for at least 100  $\mu$ s before being asserted.

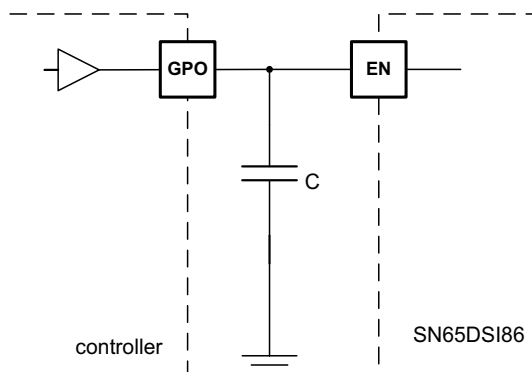

When implementing the external capacitor, the size of the external capacitor depends on the power up ramp of the  $V_{CC}$  supply, where a slower ramp-up results in a larger value external capacitor. See the latest reference schematic for the SN65DSI86 device and/or consider approximately 200-nF capacitor as a reasonable first estimate for the size of the external capacitor.

Both EN implementations are shown in Figure 6 and Figure 7.

Figure 7. EN Input from Active Controller

### 8.4.2 Power-Up Sequence

STEP NUMBER	DESCRIPTION
1	EN deasserted (LOW) and all Power Supplies active and stable. Depending on whether DPPLL_CLK_SRC is REFCLK pin or the DACP/N pins, GPIO[3:1] set to value that matches the REFCLK or DACP/N frequency. See the Table 1 for GPIO to REFCLK/DACP/N frequency combinations. If GPIO are not going to be used to select the REFCLK/DACP/N frequency, then software must program the REFCLK_FREQ register via I <sup>2</sup> C after the EN is asserted. This knowledge of the REFCLK_FREQ is also used by the DSIx6 to determine the DSI Clock frequency when DPPLL_CLK_SRC is REFCLK pin.
2	EN is asserted (HIGH).
3	Configure number of DSI channels and lanes per channel. The DSIx6 defaults to 1 lane of DSI Channel A. DSI Channel B is disabled by default. When using DSI to configure the DSIx6, software needs to keep in mind the default configuration of the DSI channels only allows access to internal CSR through either 1 lane of HSST or LPDT. Once CFR defaults are changed, all future CFR accesses should use the new DSI configuration. DSI Channel B can never be used to access internal DSIx6 CSR space. I <sup>2</sup> C access to internal DSIx6 CSR is always available.
4	Configure REFCLK or DACP/N Frequency. If GPIO[3:1] is used to set the REFCLK or DACP/N frequency, then this step can be skipped. This step must be completed before any DisplayPort AUX channel communication can occur. SW needs to program REFCLK_FREQ to match the frequency of the clock provided to REFCLK pin or DACP/N pins. The knowledge of the REFCLK_FREQ is also used by the DSIx6 to determine the DSI Clock frequency when DPPLL_CLK_SRC is REFCLK pin.
5	The SN65DSI86 supports polarity inversion of each of the MLP[3:0] and MLN[3:0] pins. This feature helps prevent any DisplayPort Main Link differential pair crossing on the PCB. If the system implementer uses this feature, then the MLx_POLR registers need to be updated to match the system implementation.

**Device Functional Modes (continued)**

STEP NUMBER	DESCRIPTION
6	The SN65DSI86 supports the ability to assign physical MLP/N[3:0] pins to a specific logical lane in order to help in the routing on the PCB. By default, physical pins MLP/N0 is logical lane 0, physical pins MLP/N1 is logical lane 1, physical pins MLP/N2 is logical lane 2, and physical pins MLP/N3 is logical lane 3. If the actual system implementation does not match the DSIx6 default values, then the LN <sub>x</sub> _ASSIGN fields need to be updated to match the system implementation.
7	By default, all interrupt sources are disabled (IRQ will not get asserted). SW needs to enable interrupt sources it cares about.
8	In an eDP application, HPD is not required. If HPD is not used, software needs to disable HPD by writing to the HPD_DISABLE register and then go to the next step. If HPD is used, then software must remain in this step until an HPD_INSERTION occurs. Once a HPD_INSERTION occurs, software can go to the next step.
9	Resolution capability of eDP Panel through reading EDID. In an eDP application, the Panel resolution capability may be known in advance. If this is the case, then this step can be skipped. Two methods are available for reading the EDID: direct method and indirect method. <ol style="list-style-type: none"> <li>Using the direct method, SW needs to program I2C_ADDR_CLAIM<sub>x</sub> registers and enable them. Once this is done, any I<sup>2</sup>C transaction that targets the I2C_ADDR_CLAIM<sub>x</sub> address will be translated into a I2C-Over-AUX transaction. In order to use the direct method, the I<sup>2</sup>C master must support clock stretching.</li> <li>Using the indirect method, SW needs to use Native and I2C-Over-Aux registers. When using the indirect method, the maximum read size allowed is 16 bytes. This means reading the EDID must be broken into 16-byte chunks.</li> </ol>
10	eDP Panel DisplayPort Configuration Data (DPCD). In eDP applications, the eDP panel DPCD information maybe known in advance. If this is the case, then this step can be skipped. SW can obtain the DPCD information by using the Native Aux Registers. The eDP panel capability is located at DisplayPort Address 0x00000 through 0x0008F. When reading the DPCD capability, SW needs to be aware that Native Aux transactions, like I2C-Over-Aux, is limited to a read size of 16 bytes. This means SW must read the DPCD in 16-byte chunks.
11	Based on resolution and capabilities of eDP sink obtained from EDID and DPCD, GPU should program the appropriate number of data lanes (DP_NUM_LANES) and data rate (DP_DATARATE) to match source capabilities and sink requirements. SSC_ENABLE can also be set if the eDP sink supports SSC.
12	Enable the DisplayPort PLL by writing a 1 to the DP_PLL_EN register. Before proceeding to next step, software should verify the PLL is locked by reading the DP_PLL_LOCK bit.
13	The SN65DSI86 only supports ASSR Display Authentication method and this method is enabled by default. An eDP panel must support this Authentication method. Software will need to enable this method in the eDP panel at DisplayPort address 0x0010A.
14	Train the DisplayPort Link. Based on the resolution requirements of the application and the capabilities of the eDP panel, software needs to choose the optimum lane count and datarate for DisplayPort Main Links. The DSIx6 provides three methods for Link Training: Manual, Fast, and Semi-Auto. <ol style="list-style-type: none"> <li>Manual Method is completely under SW control. SW can follow training steps outlined in the DisplayPort Standard or SW can perform a subset of what the DisplayPort standard requires.</li> <li>Fast Link Train. Prior knowledge of the calibrated settings is required in order to use Fast Link Train. SW needs to program both the DSIx6 and the eDP panel with the calibrated settings. Once this is done, software can change the ML_TX_MODE from Main Link Off to Fast Link Training. The DSIx6 will transmit the enabled TPS1 and/or TPS2 pattern and then transition the ML_TX_MODE to Normal Mode.</li> <li>Semi-Auto Link Training. This method is intended if there is a preferred datarate and lane count but the other parameters like TX_SWING and Pre-Emphasis are not known or eDP sink does not support Fast Training. SW can transition the ML_TX_MODE to Semi-Auto Link Training. If training is successful, the LT_PASS flag will get set and the ML_TX_MODE will be transitioned to Normal Mode. If training is unsuccessful, the LT_FAIL flag will get set and the ML_TX_MODE will transition to Main Link Off. SW then will have to specify a different data rate and/or lane count combination and attempt Auto-Link training again. This is repeated until successful link training occurs. Please keep in mind that changes in data rate will cause the DP PLL to lose lock. SW should always wait until DP_PLL_LOCK bit is set before attempting another Semi-Auto Link training.</li> </ol>
15	Video Registers need to be programmed. Video Registers are used by the DSIx6 to recreate the video timing provided from the DSI interface to the DisplayPort interface.
16	Configure GPIO control registers if default state if not used. The GPIO default to Inputs.
18	Video stream can be enabled in the GPU and sent via the DSI interface to the SN65DSI86.
19	SW can now enable the SN65DSI86 to pass the video stream provided on the DSI interface to the DisplayPort interface by writing a 1 to the VSTREAM_ENABLE register.

**8.4.3 Power Down Sequence**

STEP NUMBER	DESCRIPTION
1	Clear VSTREAM_ENABLE bit.

STEP NUMBER	DESCRIPTION
2	Stop DSI stream from GPU. DSI lanes must be placed in LP11 state.
3	Program the ML_TX_MODE to 0x0 (OFF).
4	Program the DP_NUM_LANES register to 0x0.
5	Clear the DP_PLL_EN bit.
7	Deassert the EN pin.
8	Remove power from supply pins (V <sub>CC</sub> , V <sub>CCA</sub> , V <sub>CCIO</sub> , V <sub>PLL</sub> )

### 8.4.4 Display Serial Interface (DSI)

The DSI interface can be used for two purposes: (1) Configuring SN65DSI86 CSR, and (2) Streaming RGB video to an external DisplayPort sink. When used to configure the DSIx6, all communication from the DSIx6 to the GPU (read responses) will use DSI channel A lane 0 in LP signaling mode. The SN65DSI86 supports communication from GPU to DSIx6 in both HS mode and LP mode.

#### 8.4.4.1 DSI Lane Merging

The SN65DSI86 supports one DSI data lane per input channel by default, and may be configured to support two, three, or four DSI data lanes per channel. The bytes received from the data lanes are merged in HS mode to form packets that carry the video stream or target SN65DSI86 CFR space. DSI data lanes are bit and byte aligned. Figure 8 illustrates the lane merging function for each channel; 4-Lane, 3-Lane, and 2-Lane modes are illustrated.

Figure 8. SN65DSI86 DSI Lane Merging Illustration

### 8.4.4.2 DSI Supported Data Types

Table 2 summarizes the DSI data types supported by the SN65DSI86. Any Data Type received by the DSIx6 that is not listed below will be ignored.

**Table 2. Supported HS DSI Data Types from GPU**

DATA TYPE	DESCRIPTION	DSI CHANNEL	PURPOSE
0x01	Vsync Start	A and B	Events for Video Timing
0x11	Vsync End	A and B	
0x21	Hsync Start	A and B	
0x31	HSync End	A and B	
0x08	End of Transmission packet (EoTp)	A and B	Marks the end of a HS transmission.
0x09	Null Packet	A and B	
0x19	Blanking Packet	A and B	
0x24	Generic Read Request 2 parameters	A only	Read CFR Request
0x37	Set Maximum Return Packet Size	A only	Specifies the maximum amount data returned from a Generic Read Request supported by GPU.
0x23	Generic Short Write 2 parameters	A only	Configure CFR
0x29	Generic Long Write	A only	Configure CFR and Secondary Data Packets
0x1E	Pixel Stream 18-bit RGB-666 Packed format	A and B	Active Pixel Data
0x2E	Pixel Stream 18-bit RGB-666 Loosely Packed Format	A and B	
0x3E	Pixel Stream 24-bit RGB-888 format	A and B	

**Table 3. SN65DSI86 LPDT DSI Data Type from GPU**

DATA TYPE	DESCRIPTION	DSI CHANNEL	PURPOSE
0x24	Generic Read Request 2 parameters	CHA Lane 0	Read CFR requests
0x23	Generic Short Write 2 parameters	CHA Lane 0	Configure CFR.
0x08	EoTp	CHA Lane 0	Indicates end of HS transmission.

**Table 4. SN65DSI86 DSI Data Type Responses**

DATA TYPE	DESCRIPTION	DSI CHANNEL	PURPOSE
0x11	Generic Short Read Response 1 Byte	CHA Lane 0	LPDT Response from Read Request
0x02	Acknowledge and Error Report	CHA Lane 0	LPDT Response following a Generic Read/Write with errors. Or an unsolicited BTA.
N/A	Acknowledge Trigger Message	CHA Lane 0	Trigger Message used to indicate no errors detected in Generic Request.

### 8.4.4.3 Generic Request Datatypes

The Generic Request datatypes are used for reading and writing to DSIx6 CFR space as well as for providing DisplayPort secondary data packets. The DSIx6 supports these request types in the form of high-speed data transmissions or low power data transmissions (LPDT).

To properly sample high-speed data received on the DSI interface, the DSIx6 implements a hardware mechanism, known as DSI\_CLK\_RANGE Estimator, to determine the DSI clock frequency. This hardware mechanism uses the REFCLK as a reference for calculating the DSI clock frequency. When the REFCLK\_FREQ register correctly matching the REFCLK frequency, the DSI\_CLK\_RANGE Estimator will be able determine the DSIA and DSIB clock frequency. The DSI\_CLK\_RANGE Estimator requires a throw-away read (that is, read from address 0x00) before hardware will update CHA\_DSI\_CLK\_RANGE and CHB\_DSI\_CLK\_RANGE registers. Note

that this first access may set some DSI error bits. In the cases where the system designer does not wish to use the DSI\_CLK\_RANGE Estimator, software can write the desired DSI Clock frequency to the CHA\_DSI\_CLK\_RANGE and CHB\_DSI\_CLK\_RANGE. Once these registers are written, the DSI\_CLK\_RANGE Estimator will be disabled and it becomes system software responsibility to make sure the CHA\_DSI\_CLK\_RANGE and CHB\_DSI\_CLK\_RANGE registers always reflect the actual DSI clock frequency.

#### 8.4.4.3.1 Generic Read Request 2-Parameters Request

The Generic Read Request with 2 parameters will be used for reading DSIx6 CFR registers. The current address space requirement for the SN65DSI86 is just 256 bytes. This means the MS Byte of ADDR (bits 15 to 8) will always be zero. The MS Byte of the ADDR is intended for future expansion. The SN65DSI86 response size defaults to one byte as defined by [DSI]. Software can use the Set Maximum Return Packet Size to inform the DSI86 that the GPU can support more than one byte, but the DSIx6 will always provide a response of one byte. If a single-bit ECC error was detected and corrected in the request, the DSIx6 will provide the requested data along with an Acknowledge and Error Report packet. If multi-bit ECC errors are detected and not corrected, the DSIx6 will only respond with an Acknowledge and Error Report packet.

SOT	ID = 0x24	ADDR (LS Byte)	ADDR (MS Byte)	ECC	EOT
-----	-----------	----------------	----------------	-----	-----

**Figure 9. Generic Read Request 2 Parameters Format**

#### 8.4.4.3.2 Generic Short Write 2-Parameters Request

The Generic Short Write with 2 parameters can be used for writing to SN65DSI86 CFR registers. The first parameter is the CFR Address and the second parameter is the data to be written to the address pointed to by the first parameter.

SOT	ID = 0x23	ADDR (Byte)	DATA	ECC	EOT
-----	-----------	-------------	------	-----	-----

**Figure 10. Generic Short Write Request 2 Parameters Format**

**NOTE**

If GPU completes transmission with a BTA, the SN65DSI86 will respond with either an Acknowledge, if no errors were detected in current or previous packets, or an Acknowledge and Error Report packet, if errors were detected in current or previous packets.

#### 8.4.4.3.3 Generic Long Write Packet Request

The Generic Long Write packet is used to write to CFRS within the SN65DSI86 as well as send secondary data packet to the eDP panel. The MS Byte of ADDR (bits 15 to 8) must be used to select whether the packet is SDP or whether it targets SN65DSI86 CFR registers. If the MS Byte of ADDR is equal to 0x80, then the DSIx6 will interpret the Generic Long Write to be a secondary data packet. If the MS Byte of ADDR is equal to 0x00, then the SN65DSI86 will interpret the Generic Long Write to target CFR space. For all other values of MS Byte of the ADDR, the DSIx6 will ignore the request and set the appropriate error flag.

SOT	ID = 0x29	WC (LS Byte)	WC (MS Byte)	ECC	ADDR (LS Byte)	ADDR (MS Byte)	DATA0	DATA1	DATA [WC-3]	CHKSUM (LS Byte)	CHKSUM (MS Byte)	EOT
-----	-----------	--------------	--------------	-----	----------------	----------------	-------	-------	-------------	------------------	------------------	-----

**Figure 11. Generic Long Write Format**

**NOTE**

The WC field value must include the two ADDR bytes and the amount of data to be written. For example, if the amount of data to be written is 1 byte, then the WC(LS Byte) must be 0x03 and the WC(MS Byte) must be 0x00. Also, the maximum WC field value supported by the SN65DSI86 is 258 bytes or (0x0102). When writing to DSIx6 CFR space, the maximum WC field value supported is three bytes. If GPU completes transmission with a BTA, the DSIx6 must respond with either an Acknowledge, if no errors were detected in current or previous packets, or an Acknowledge and Error Report packet, if errors were detected in current or previous packets.

### 8.4.4.4 DSI Pixel Stream Packets

The SN65DSI86 processes 18 bpp (RGB666) and 24 bpp (RGB888) DSI packets on each channel as illustrated below:

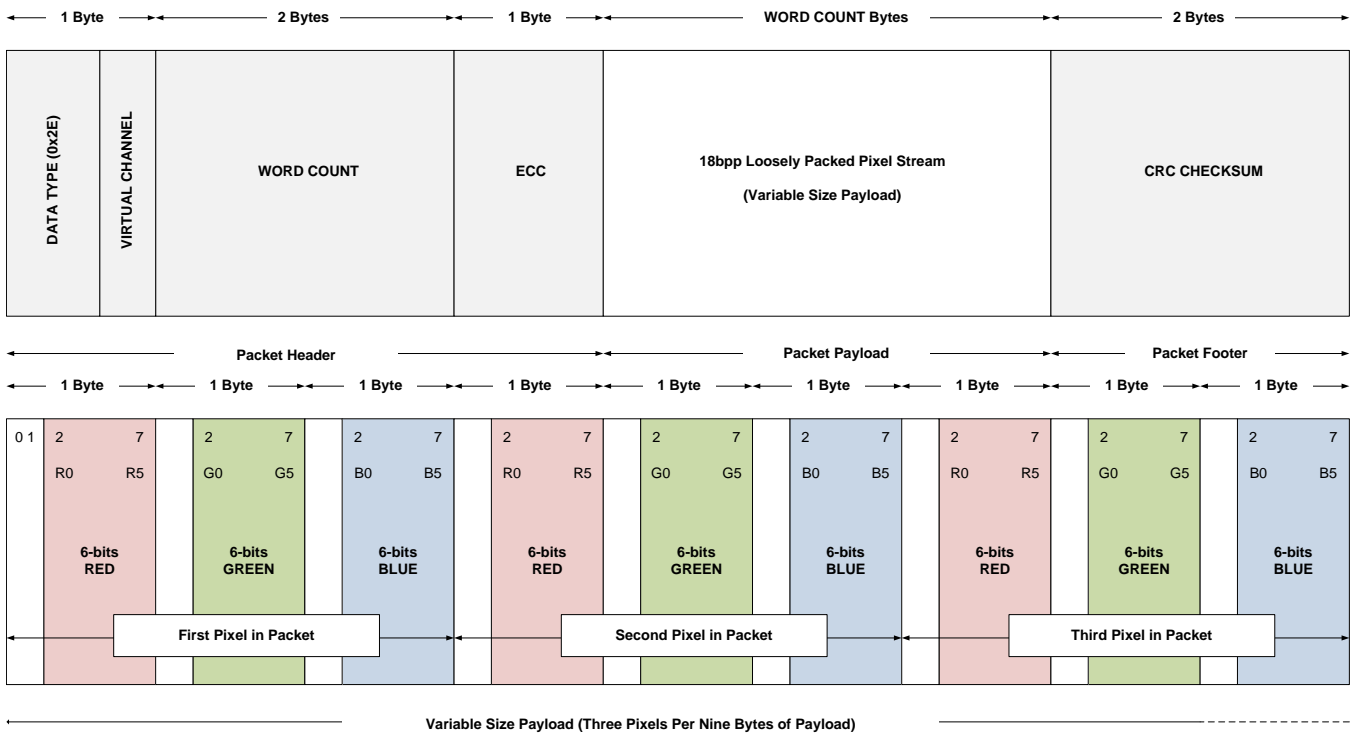

Figure 12. 18 bpp (Loosely Packed) DSI Packet Structure

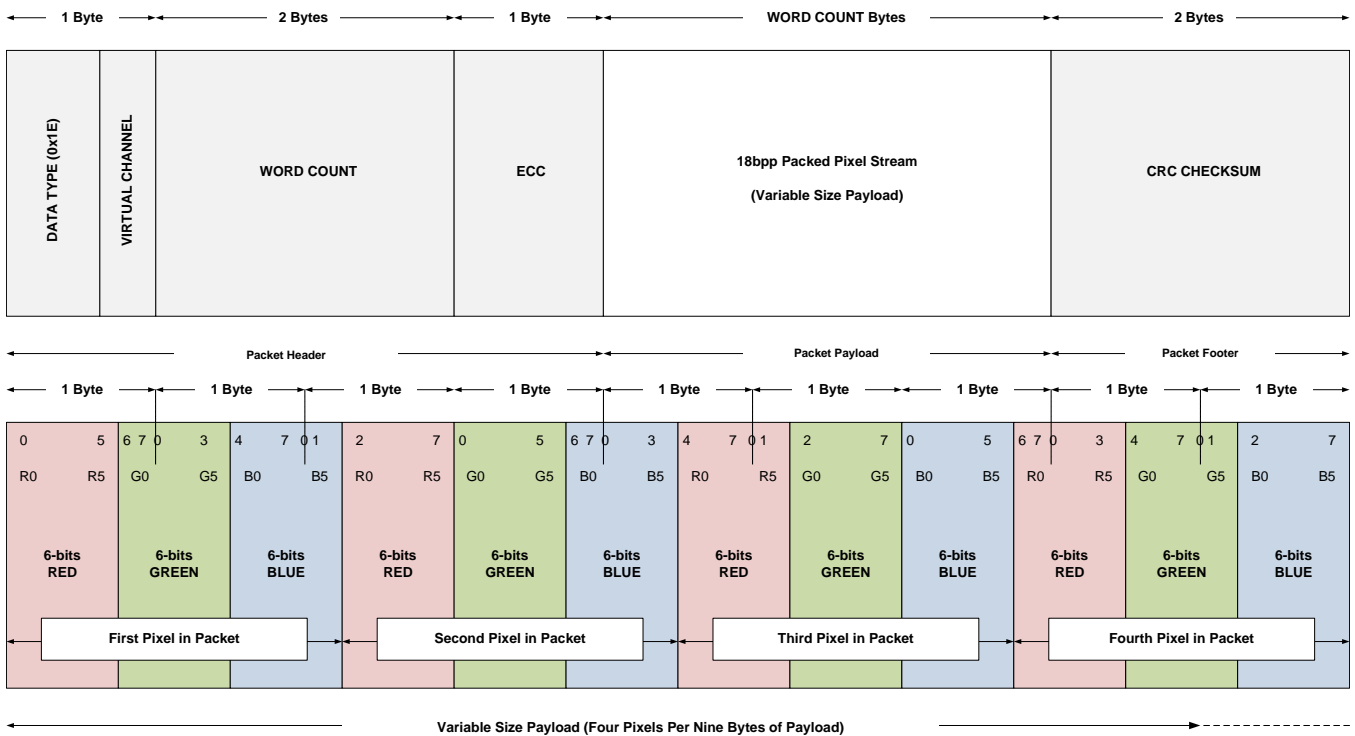

Figure 13. 18 bpp (Tightly Packed) DSI Packet Structure

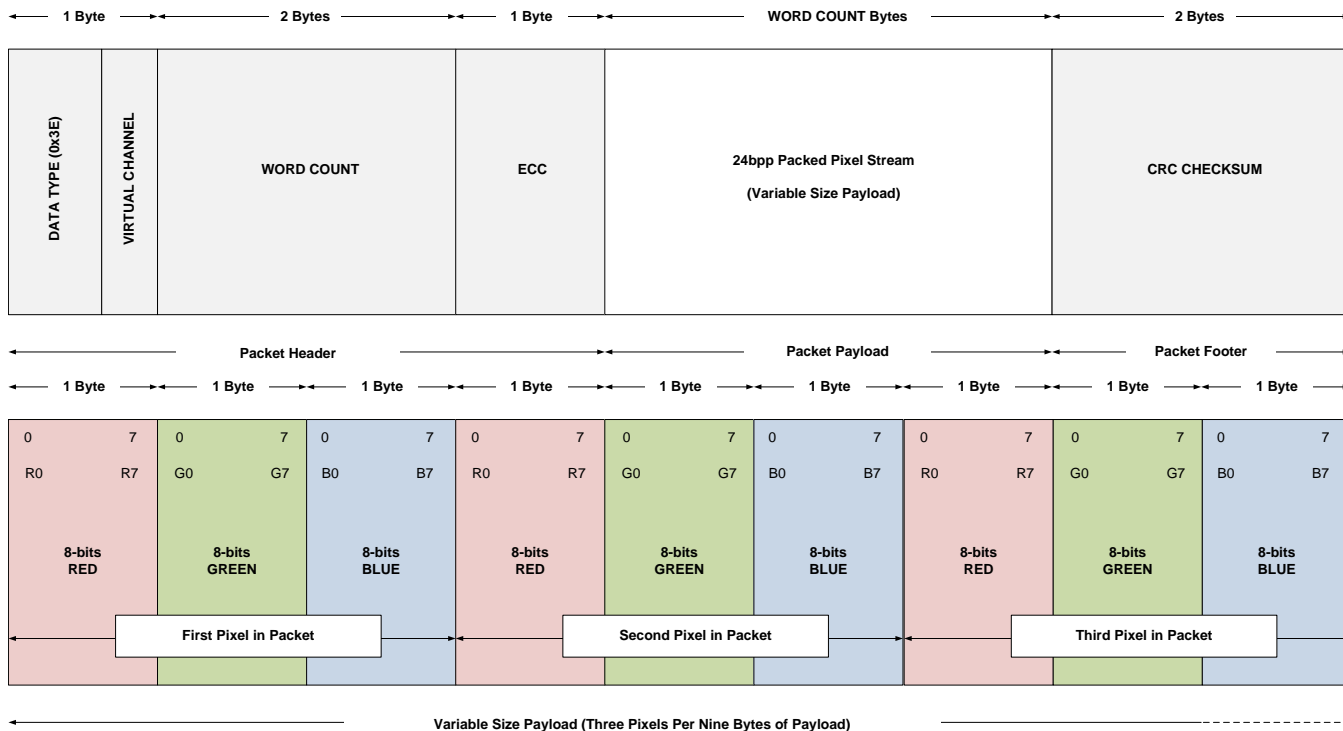

Figure 14. 24bpp DSI Packet Structure

Table 5. Example of 4-Lane DSI Packet Data for 24 bpp RGB

Lane 0	Lane 1	Lane 2	Lane 3
SOT	SOT	SOT	SOT
0x3E	WC (LS Byte)	WC (MS Byte)	ECC
R0-7:0	G0-7:0	B0-7:0	R1-7:0
G1-7:0	B1-7:0	R2-7:0	G2-7:0
B2-7:0	R3-7:0	G3-7:0	B3-7:0
R4-7:0	G4-7:0	B4-7:0	R5-7:0
G5-7:0	B5-7:0	CRC (LS Byte)	CRC (MS Byte)
EOT	EOT	EOT	EOT

8.4.4.5 DSI Video Transmission Specifications

The SN65DSI86 expects the GPU to provide video timing events and active pixel data in the proper order in the form of a real-time pixel stream. According to the DSI specification [DSI], active pixel data is transmitted in one of two modes: Non-Burst and Burst. The SN65DSI86 supports both non-burst and burst mode packet transmission. The burst mode supports time-compressed pixel stream packets that leave added time per scan line for power savings LP mode. For a robust and low-power implementation, the transition to LP mode is recommended on every video line, although once per frame is considered acceptable.

According to the DSI specification [DSI], timing events can be provided in one of two types: Sync Pulses, and Sync Events. The vsupports both types. For the Sync Pulse type of timing event, the GPU will send VSYNC START (VSS), VSYNC END (VSE), HSYNC START (HSS), and HSYNC END (HSE) packets. For Sync Event type, the GPU will only send the sync start packets (VSS and HSS). For both types of timing events, the DSIx6 will use the values programmed into the Video Registers to determine the sync end events (VSE and HSE). Please note when configured for dual DSI channels, the SN65DSI86 will use VSS, VSE, and HSS packets from channel A. The DSIx6 will use channel A events to recreate the same timings on the DisplayPort interface. The VSS, VSE, and HSS packets from channel B are used to internally align data on channel B to channel A.

The first line of a video frame must start with a VSS packet, and all other lines start with VSE or HSS. The position of the synchronization packets in time is of utmost importance because this has a direct impact on the visual performance of the display panel.

As required in the DSI specification, the v requires that pixel stream packets contain an integer number of pixels (that is, end on a pixel boundary); TI recommends to transmit an entire scan line on one pixel stream packet. When a scan line is broken in to multiple packets, inter-packet latency must be considered such that the video pipeline (that is, pixel queue or partial line buffer) does not run empty (that is, under-run); during scan line processing. If the pixel queue runs empty, the SN65DSI86 transmits zero data (18'b0 or 24'b0) on the DisplayPort interface.

When configured for dual DSI channels, the SN65DSI86 supports ODD/EVEN configurations and LEFT/RIGHT configurations. In the ODD/EVEN configuration, the odd pixels for each scan line are received on channel A, and the even pixels are received on channel B. In LEFT/RIGHT mode, the left portion of the line is received on channel A, and the right portion of the line is received on channel B. The pixels received on channel B in LEFT/RIGHT mode are buffered during the left-side transmission to DisplayPort, and begin transmission to DisplayPort when the left-side input buffer runs empty. The only requirement for LEFT/RIGHT mode is CHB\_ACTIVE\_LINE\_LENGTH must be at least 1 pixel.

---

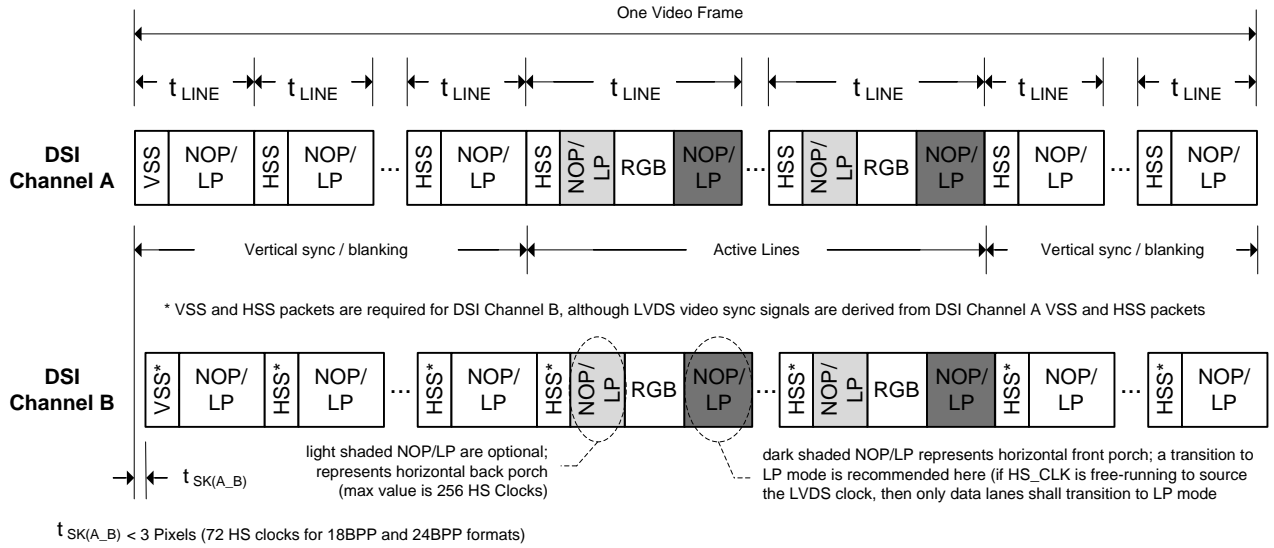

**NOTE**

The DSIx6 does not support the DSI Virtual Channel capability.

---

**Table 6. Summary of DSI Video Input Requirements**

NUMBER	REQUIREMENT
1	DSI datatypes VSS and HSS are required, but datatypes HSE and VSE are optional.
2	The exact time interval between each HSS must be maintained.
3	The time between the HSS and HACT (known as HBP) does not have to be maintained. The DSIx6 will recreate HBP on DisplayPort.
4	The time from the end of HACT to HSS (known as HFP) does not have to be maintained. The DSIx6 will recreate HFP on DisplayPort.
5	The time from VSS to first line of active video must be maintained.
6	The time from end of last line of active video to the beginning of the first line of active video must be maintained. This time is defined as the Vertical Blanking period.

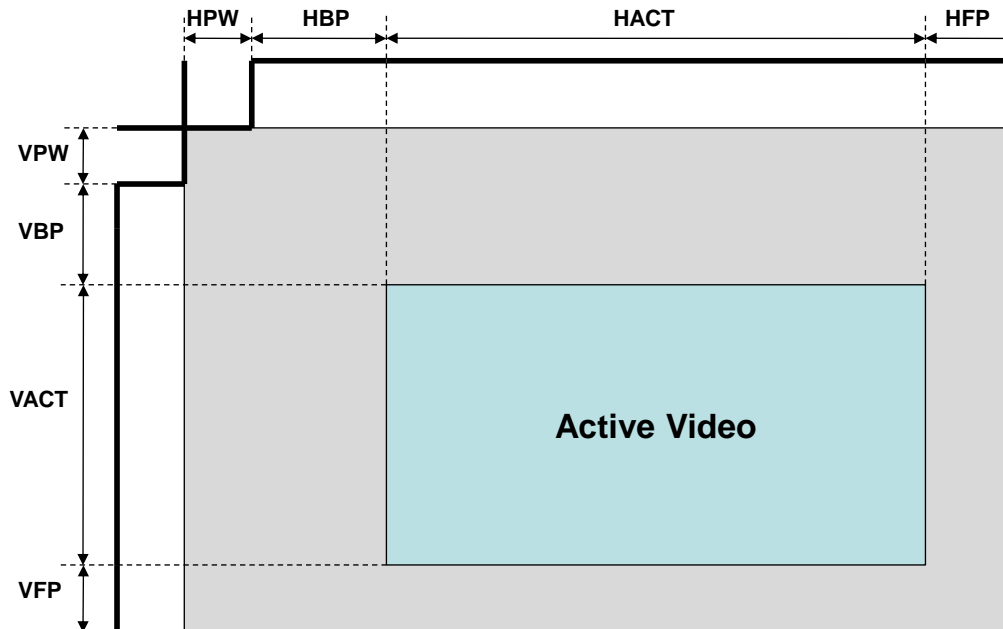

LEGEND	
VSS	DSI Sync Event Packet: V Sync Start
HSS	DSI Sync Event Packet: H Sync Start
RGB	A sequence of DSI Pixel Stream Packets and Null Packets
NOP/LP	DSI Null Packet, Blanking Packet, or a transition to LP Mode

Figure 15. DSI Channel Transmission and Transfer Function

#### 8.4.4.6 Video Format Parameters

It is the responsibility of the GPU software to program the DSIX6 *Video Registers* with the Video format that is expected to be displayed on the eDP panel. The DSIX6 expects the parameters in [Table 7](#) to be programmed. The DSIX6 will use these parameters to determine the DisplayPort MSA parameters that are transmitted over DisplayPort every vertical blanking period. These MSA parameters are used by the eDP panel to recreate the video format provided on the DSI interface.

**Figure 16. Video Format**

**Table 7. Video Format Parameters**

PARAMETER	DESCRIPTION	DSIX6 REGISTER
HPOL	Used to specify if the HPW is high or low.	CHA_HSYNC_POLARITY
HPW	The width of the Horizontal Sync Pulse in pixels	{CHA_HSYNC_PULSE_WIDTH_HIGH, CHA_HSYNC_PULSE_WIDTH_LOW}
HBP	The size of the Horizontal Back Porch in pixels	CHA_HORIZONTAL_BACK_PORCH
HACT	The length, in pixels, of the active horizontal line.	{CHA_ACTIVE_LINE_LENGTH_HIGH, CHA_ACTIVE_LINE_LENGTH_LOW} + {CHB_ACTIVE_LINE_LENGTH_HIGH, CHB_ACTIVE_LINE_LENGTH_LOW}
HFP	The size of the Horizontal Front Porch in pixels.	CHA_HORIZONTAL_FRONT_PORCH
HTOTAL	Total length, in pixels, of a horizontal line.	HPW + HBP + HACT + HFP
VPOL	Used to specify if the VPW is high or low	CHA_VSYNC_POLARITY
VPW	The width of the Vertical Sync Pulse in lines. The width must be at least 1 line.	{CHA_VSYNC_PULSE_WIDTH_HIGH, CHA_VSYNC_PULSE_WIDTH_LOW}
VBP	The size of the Vertical Back Porch in lines. The size must be at least 1 line.	CHA_VERTICAL_BACK_PORCH
VACT	The number of vertical active lines.	{CHA_VERTICAL_DISPLAY_SIZE_HIGH, CHA_VERTICAL_DISPLAY_SIZE_LOW}
VFP	The size of the Vertical Front Porch in lines. The size must be at least 1 line.	CHA_VERTICAL_FRONT_PORCH
VTOTAL	The total number of vertical lines in a frame.	VPW + VBP + VACT + VFP

#### 8.4.4.7 GPU LP-TX Clock Requirements

The GPU is responsible for controlling its own LP clock frequency to match the DS1x6. The GPU LP TX clock frequency must be in the range of 67% to 150% of the DS1x6 LP TX clock frequency. The DS1x6 LP TX clock frequency is detailed in [Table 8](#).

**Table 8. DS1x6 LP TX Clock Frequency**

REFCLK_FREQ	LP TX Clock Frequency
0x0	12 MHz
0x1	19.2 MHz
0x2	13 MHz
0x3	13.5 MHz
0x4	19.2 MHz

#### 8.4.5 DisplayPort

The SN65DSI86 supports Single-Stream Transport (SST) mode over 1, 2, or 4 lanes at a datarate of 1.62 Gbps, 2.16 Gbps, 2.43 Gbps, 2.7 Gbps, 3.24 Gbps, 4.32 Gbps, or 5.4 Gbps. The SN65DSI86 does not support Multi-Stream Transport (MST) mode.

##### 8.4.5.1 HPD (Hot Plug/Unplug Detection)

The HPD signal is used by a DisplayPort source (DS1x6) for detecting when a downstream port (DisplayPort Panel) is attached or removed as well as for link status information. The [EDP] specification states that the HPD signal is required for an eDP Panel but is optional for a eDP source (DS1x6). The DS1x6 supports the HPD signal. It is up to the system implementer to determine if HPD signal is needed for the DS1x6. If not used, the system implementer should pull-up HPD to 3.3 V or set the HPD\_DISABLE bit. If HPD\_DISABLE is set, then all HPD events (IRQ\_HPDP, HPD\_REMOVAL, HPD\_INSERTION, HPD\_REPLUG) are disabled.

When IRQ\_EN and IRQ\_HPDP\_EN is enabled, the DS1x6 will assert the IRQ whenever the eDP generates a IRQ\_HPDP event. An IRQ\_HPDP event is defined as a change from INSERTION state to the IRQ\_HPDP state.

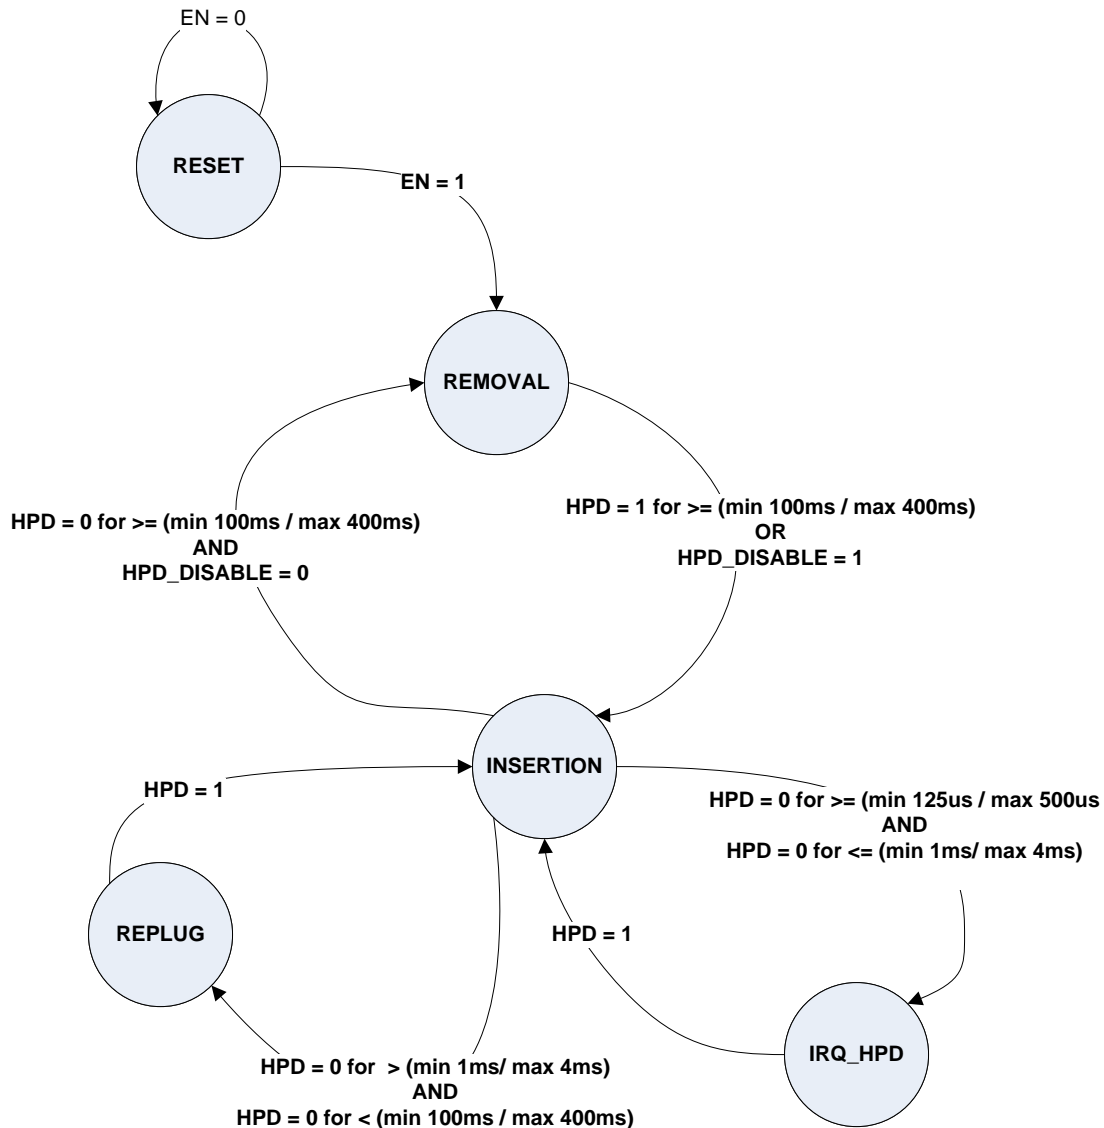

The DS1x6 will also interpret a DisplayPort device removal or insertion as an HPD\_REMOVAL or HPD\_INSERTION event. A HPD\_REMOVAL event is defined as a change that causes the HPD state to transition from INSERTION state to the REMOVAL state. A HPD\_INSERT event is defined as a change that causes the HPD state to transition from the REMOVAL state to the INSERTION state. The REPLUG event is caused by the sink deasserting HPD for more than 2 ms but less than 100 ms. If software needs to determine the state of the HPD pin, it should read the HPD Input register. The HPD state machine operates off an internal ring oscillator. The ring oscillator frequency will vary based on PVT (process voltage temperature). The min/max range in the HPD State Diagram refers to the possible times based off variation in the ring oscillator frequency.

---

#### NOTE

HPD has a minimum of 60-k $\Omega$   $\pm$ 15% internal pulldown resistor.

---

**Figure 17. HPD State Diagram**

### 8.4.5.2 AUX\_CH

The AUX\_CH supported by the SN65DSI86 is a half-duplex, bidirectional, ac-coupled, doubly-terminated differential pair. Manchester-II coding is used as the channel coding for the AUX\_CH and supports a data rate of 1 Mbps. Fast AUX (also known as FAUX) is not supported by the DSIX6. Over the AUX\_CH, the DSIX6 will always transmit the most significant bit (MSB) first and the least significant bit (LSB) last. Bit 7 is the MSB and Bit 0 is the LSB.

The AUX\_CH provides a side-band channel between the SN65DSI86 and the downstream eDP device. Through the AUX\_CH, the following is some of the information which can be obtained from or provided to the downstream eDP device:

1. eDP Downstream DPCD capabilities (number of lanes, data rate, display authenticate method, and so on)
2. EDID information of display like native resolution (obtained by I<sup>2</sup>C over AUX transactions)
3. Link training and status
4. MCCC control

### 8.4.5.2.1 Native Aux Transactions

Native Aux transaction is broken into two pieces: Request and Reply. The DSIx6 will always be the originator of the Request (sometimes under GPU control and other times under DSIx6 HW control) and the recipient of the Reply from the downstream device.

Request Syntax: <4-bit AUX\_CMD> <20-bit AUX\_ADDR> <7-bit AUX\_LENGTH> <DATA0 ... DATA15>

Reply Syntax: <4-bit AUX\_CMD> <4'b0000> <DATA0 ... DATA15>

**Table 9. Definition of the AUX\_CMD Field for Request Transactions**

AUX_CMD[3:0]	DESCRIPTION
0x0	I2C-Over-Aux Write MOT = 0.
0x1	I2C-Over-Aux Read MOT = 0
0x2	I2C-Over-Aux Write Status Update MOT = 0.
0x3	Reserved. DSIx6 will ignore.
0x4	I2C-Over-Aux Write MOT = 1
0x5	I2C-Over-Aux Read MOT = 1
0x6	I2C-Over-Aux Write Status Update MOT=1.
0x7	Reserved. SN65DSI86 will ignore.
0x8	Native Aux Write
0x9	Native Aux Read
0xA through 0xF	Reserved. SN65DSI86 will ignore.

For Native Aux Reply transactions, the DSIx6 will update the status field in the CFR with command provided by the eDP device. For example, if the eDP receiver replies with a AUX\_DEFER, the DSIx6 will attempt the request seven times (100  $\mu$ s between each attempt) before updating the AUX\_DEFER status field with 1'b1. If the eDP receiver does NOT reply before the 400- $\mu$ s reply timer times out, then the SN65DSI86 will wait 100  $\mu$ s before trying the request again. The SN65DSI86 will retry the request 7 times before giving up and then update the AUX\_RPLY\_TOUT field with 1'b1.

Example: Native Aux read of the eDP receiver capability field at DCPD address 0x00000h through 0x00008

1. Software programs the AUX\_CMD field with 0x9.
2. Software programs the AUX\_ADDR[19:16] field with 0x0.
3. Software programs the AUX\_ADDR[15:8] field with 0x0.
4. Software programs the AUX\_ADDR[7:0] field with 0x0.
5. Software programs the AUX\_LENGTH field with 0x8.
6. Software sets the SEND bit.
7. DSIx6 will transmit the following packet: <SYNC> <0x90> <0x00> <0x00> <0x07> <STOP>
8. Within 300  $\mu$ s, the eDP receiver will reply with the following: <SYNC> <0x00> <DATA0> <DATA1> <DATA2> <DATA3> <DATA4> <DATA5> <DATA6> <DATA7> <STOP>
9. DSIx6 will update AUX\_RDATA0 through AUX\_RDATA7 with the data received from the eDP receiver.
10. DSIx6 will update the AUX\_LENGTH field with 0x8 indicating eight bytes we received.
11. DSIx6 will then clear the SEND bit.
12. If enabled, the IRQ will be asserted to indicate to GPU that the Native Aux Read completed.
13. GPU should read from the Interrupt Status register to see if the Native Aux Read completed successfully.

### 8.4.5.3 I2C-Over-AUX

There are two methods available for I2C-Over-Aux: Direct Method (also known as Clock stretching) and Indirect Method (CFR Read/Write).

#### 8.4.5.3.1 Direct Method (Clock Stretching)

The Direct Method (Clock Stretching) involves delaying the acknowledge or data to the I<sup>2</sup>C Master by the SN65DSI86 driving the SCL pin low. Once the SN65DSI86 is ready to acknowledge an I<sup>2</sup>C write transaction or return read data for a I<sup>2</sup>C read transaction, the SN65DSI86 will tri-state the SCL pin therefore allowing the acknowledge cycle to complete.

In order to enable the Direct Method (Clock Stretching) software must do the following:

1. Program the 7-bit I<sup>2</sup>C slave address(s) into the I2C\_ADDR\_CLAIMx register(s).
2. Enable Direct Method by setting the I2C\_CLAIMx\_EN bit(s)

#### 8.4.5.3.2 Indirect Method (CFR Read/Write)

The Indirect Method is intended to be used by a GPU which does NOT support the Direct Method (Clock Stretching). The Indirect Method involves programming the appropriate CFR registers. The Indirect Method is very similar to the Native Aux method described above.

Example of Indirect I<sup>2</sup>C Read of the EDID.

1. Program the AUX\_CMD = 0x4, AUX\_ADDR[7:0] = 0x50, and AUX\_LENGTH = 0x00.
2. Set the SEND bit.
3. The SN65DSI86 will clear the SEND bit once the Request has been ACKed.
4. If SEND\_INT\_EN is enabled and IRQ\_EN is enabled, an IRQ will be asserted. GPU should make sure no error flags are set. If no error flags are set, GPU should clear the SEND\_INT flag and go to step 5.
5. Program the AUX\_CMD = 0x4, AUX\_ADDR[7:0] = 0x50, AUX\_LENGTH = 0x01, and AUX\_WDATA0 = 0x00.
6. Set the SEND bit.
7. The SN65DSI86 will clear the SEND bit once the Request has been ACKed.
8. If SEND\_INT\_EN is enabled and IRQ\_EN is enabled, an IRQ will be asserted. GPU should make sure no error flags are set. If no error flags are set, GPU should clear the SEND\_INT flag and go to step 9.
9. Program the AUX\_CMD = 0x5, AUX\_ADDR[7:0] = 0x50, and AUX\_LENGTH = 0x00.
10. Set the SEND bit.
11. The SN65DSI86 will clear the SEND bit once the Request has been ACKed.
12. If SEND\_INT\_EN is enabled and IRQ\_EN is enabled, an IRQ will be asserted. GPU should make sure no error flags are set. If no error flags are set, GPU should clear the SEND\_INT flag and go to step 13.
13. Program the AUX\_CMD = 0x5, AUX\_ADDR[7:0] = 0x50, and AUX\_LENGTH = 0x10.
14. Set the SEND bit.
15. The SN65DSI86 will clear the SEND bit once the Request has been ACKed.
16. If SEND\_INT\_EN is enabled and IRQ\_EN is enabled, an IRQ will be asserted. GPU should make sure no error flags are set. If no error flags are set, GPU should clear the SEND\_INT flag, read data from AUX\_RDATA0 through AUX\_DATA15, and go to step 13.
17. If read of EDID is complete, then go to step 18. If read of EDID is not complete, then go to Step 13.
18. Program the AUX\_CMD = 0x1, AUX\_ADDR[7:0] = 0x50, and AUX\_LENGTH = 0x00.
19. Set the SEND bit.
20. The SN65DSI86 will clear the SEND bit once the Request has been ACKed.
21. If SEND\_INT\_EN is enabled and IRQ\_EN is enabled, an IRQ will be asserted. GPU should make sure no error flags are set. If no error flags are set, GPU should clear the SEND\_INT flag and go to step 22.
22. Read of EDID finished.

Example of an indirect I<sup>2</sup>C Write (Changing EDID Segment Pointer):

1. Program the AUX\_CMD = 0x4, AUX\_ADDR[7:0] = 0x30, and AUX\_LENGTH = 0x00.
2. Set the SEND bit.
3. The SN65DSI86 will clear the SEND bit once the Request has been ACKed.
4. If SEND\_INT\_EN is enabled and IRQ\_EN is enabled, an IRQ will be asserted. GPU should make sure no error flags are set. If no error flags are set, GPU should clear the SEND\_INT flag and go to step 5.
5. Program the AUX\_CMD = 0x4, AUX\_ADDR[7:0] = 0x30, AUX\_LENGTH = 0x01, and AUX\_WDATA0 = 0x01.
6. Set the SEND bit.
7. The SN65DSI86 will clear the SEND bit once the Request has been ACKed.
8. If SEND\_INT\_EN is enabled and IRQ\_EN is enabled, an IRQ will be asserted. GPU should make sure no error flags are set. If no error flags are set, GPU should clear the SEND\_INT flag and go to step 9.
9. Program the AUX\_CMD = 0x0, AUX\_ADDR[7:0] = 0x30, and AUX\_LENGTH = 0x00.
10. Set the SEND bit.
11. The SN65DSI86 will clear the SEND bit once the Request has been ACKed.
12. If SEND\_INT\_EN is enabled and IRQ\_EN is enabled, an IRQ will be asserted. GPU should make sure no error flags are set. If no error flags are set, GPU should clear the SEND\_INT flag and go to step 13.
13. Finished.

The SN65DSI86 will handle all aspects of completing a request I2C-Over-Aux Read or Write. Once the requested Read or Write completes, the SN65DSI86 will clear the SEND bit and if an error occurred, the SN65DSI86 will set the NAT\_I2C\_FAILED flag. The NAT\_I2C\_FAILED flag will get set if for some reason the slave NACK the I<sup>2</sup>C Address. If the Slave NACK without completing the entire request AUX\_LENGTH, the SN65DSI86 will set the AUX\_SHORT flag and update the AUX\_LENGTH register with the amount of data completed and then clear the SEND bit. Upon clearing the SEND bit and if IRQ assertion is enabled, the SN65DSI86 will assert IRQ.

#### 8.4.5.4 DisplayPort PLL

By default, the DisplayPort PLL is disabled (DP\_PLL\_EN = 0). To perform any operations over the DisplayPort Main link interface, the DP\_PLL\_EN must be enabled. Before enabling the DisplayPort PLL, software must program the DP\_DATARATE register with the desired datarate. Also if SSC is going to be used, the SSC\_ENABLE and SSC\_SPREAD should also be programmed. Once the DP\_PLL\_EN is programmed to 1, software should wait until the DP\_PLL\_LOCK bit is set before performing any DisplayPort Main Link operations.

Depending on SN65DSI86 configuration, the amount of time for the DP PLL to lock will vary. [Table 10](#) describes the lock times for various configurations.

**Table 10. DP\_PLL Lock Times**

REFCLK_FREQ	SSC_ENABLE	MAXIMUM LOCK TIME
0	X	20 μs + (1152 × T <sub>REFCLK</sub> )
1	X	
2	X	
4	X	
3	1	
3	0	20 μs + (128 × T <sub>REFCLK</sub> )

#### 8.4.5.5 DP Output VOD and Pre-emphasis Settings

The SN65DSI86 has user configurable VOD, pre-emphasis, and post-cursor2 levels. The post cursor 2 level is defined by the DP\_POST\_CURSOR2 level. The VOD and pre-emphasis levels are defined by the *DP Link Training Lookup Table*. The defaults settings from this lookup table are described in [Table 11](#).

**Table 11. Pre-Emphasis Default Settings**

VOD LEVEL	PRE-EMPHASIS			
	LEVEL 0	LEVEL 1	LEVEL 2	LEVEL 3
Level 0 (400 mV)	Enabled (0 dB)	Enabled (3.74 dB)	Enabled (6.02 dB)	Disabled
Level 1 (600 mV)	Enabled (0 dB)	Enabled (3.10 dB)	Enabled (5.19 dB)	Disabled
Level 2 (800 mV)	Enabled (0 dB)	Enabled (2.50 dB)	Disabled	Disabled
Level 3	Disabled	Disabled	Disabled	Disabled

All of these default values can be changed by modifying the values in the DP Link Training Lookup Table

#### 8.4.5.6 DP Main Link Configurability

The SN65DSI86 has four physical DisplayPort lanes and each physical lane can be assigned to one specific logical lane. By default, physical lanes 0 through 3 are mapped to logical lanes 0 through 3. When routing between the SN65DSI86 and a non-standard eDP receptacle, the physical to logical lane mapping can be changed so that PCB routing complexity is minimized. [Table 12](#) depicts the supported logical to physical combinations based on the number of lanes programmed into the DP\_NUM\_LANES registers.

**Table 12. Logical to Physical Supported Combinations**

DP_NUM_LANES	LN0_ASSIGN	LN1_ASSIGN	LN2_ASSIGN	LN3_ASSIGN
1	0 or 1. 0 is recommended.			
2	0 or 1	0 or 1		
4	0, 1, 2, or 3	0, 1, 2, or 3	0, 1, 2, or 3	0, 1, 2, or 3

**NOTE**

The SN65DSI86 DisplayPort logic uses clocks from physical lane 0, and therefore these clocks from physical lane 0 will be active whenever the DP PLL is enabled. When using less than four DP lanes, the optimal power consumption is achieved by always using physical lane 0.

#### **8.4.5.7 DP Main Link Training**

The SN65DSI86 supports four methods to train the DisplayPort link:

1. Manual Training
2. Fast Training
3. Semi-Auto Training
4. Redriver Semi-Auto Training

**NOTE**

It is software responsibility to enable the Display Authentication Method in the eDP Display before any link training can be performed. The SN65DSI86 is enabled for ASSR authentication method by default. The SN65DSI86 supports Enhanced Framing. If the eDP panel supports DPCD Revision 1.2 or higher, software must enable the Enhanced Framing Mode.

##### **8.4.5.7.1 Manual Link Training**

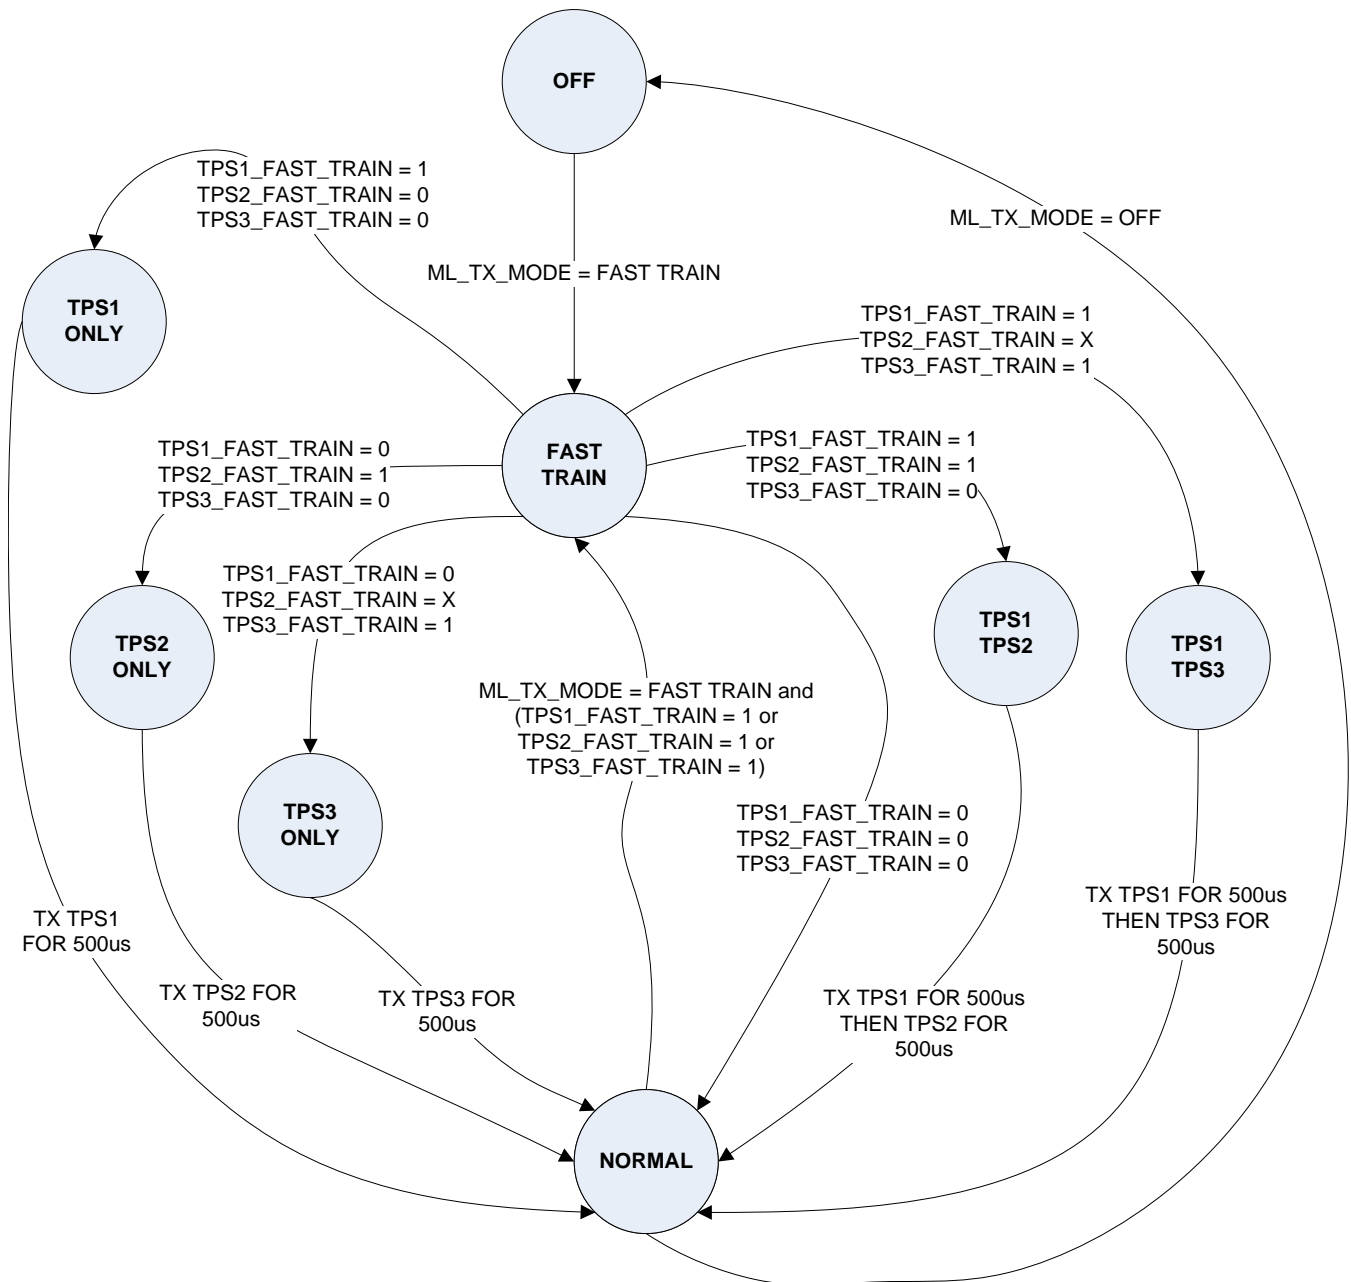

This method is completely under software control. Software is required to handle the entire link training process.

##### **8.4.5.7.2 Fast Link Training**

In order to use the Fast Training method, there must be prior knowledge of the eDP receiver capabilities. Software must program both the SN65DSI86 and the eDP receiver with pre-calibrated parameters (DP\_TX\_SWING, DP\_PRE\_EMPHASIS, DP\_NUM\_LANES, and DP\_DATARATE). Upon completing the programming of the pre-calibrated settings, software must transition the ML\_TX\_MODE to Fast Link Training. If TPS1 during Fast Link Training is enabled, SN65DSI86 will then transmit the clock recovery pattern (TPS1) for at least 500  $\mu$ s and then transition ML\_TX\_MODE to normal. If TPS2 during Fast Link training is enabled, then after the TPS1, the SN65DSI86 will transmit TPS2 for 500  $\mu$ s before transitioning ML\_TX\_MODE to normal. If neither TPS1 nor TPS2 during Fast Link Training is enabled, then the SN65DSI86 will transition straight to normal mode.

**NOTE**

GPU should determine if the eDP Display supports Fast Link training by reading the NO\_AUX\_HANDSHAKE\_LINK\_TRAINING bit at DCPD address 0x00003 bit 6. If this bit is set, then the eDP Display supports Fast Link Training.

**Figure 18. Fast-Link Training State Diagram**

#### 8.4.5.7.3 Semi-Auto Link Training

In order to use the semi-auto link training mode, software must first program the target `DP_NUM_LANES` and `DP_DATARATE`. Once these fields have been programmed, software can then transition the `ML_TX_MODE` to Semi-Auto Link Training. The SN65DSI86 will then attempt to train the DisplayPort link at the specified datarate and number of lanes. The SN65DSI86 will try all possible combinations of `DP_PRE_EMPHASIS` and `DP_TX_SWING`. Training will end as soon as a passing combination is found or all combinations have been tried and failed. The possible combinations are determined by the setting in the *DP Link Training LUT registers*. If training is successful, the SN65DSI86 will update the `DP_POST_CURSOR2`, `DP_PRE_EMPHASIS`, and

DP\_TX\_SWING with the passing combination and then transition the ML\_TX\_MODE to normal. If training is unsuccessful, the SN65DSI86 will transition the ML\_TX\_MODE to Main Link Off. If enabled, the DSI will assert the IRQ pin whether or not training was successful. Software will then need to specify a different target DP\_NUM\_LANES and DP\_DATARATE and then transition the ML\_TX\_MODE to Semi-Auto Link Training. This process is repeated until successful link training occurs.

#### NOTE

After software has enabled Semi-Auto Linking training, software must wait for the training to complete before performing any AUX transactions (Native Aux or I2C-Over-Aux).

#### 8.4.5.7.4 Redriver Semi-Auto Link Training

In some systems a DisplayPort redriver (like the DP130) would sit between the SN65DSI86 and the eDP panel. In these applications, it is important to train the DisplayPort link between the SN65DSI86 and the redriver to one setting and training the link between the redriver and the eDP panel to a different setting. For this application, Redriver Semi-Auto Link training can be used.

Redriver Semi-Auto Link training is essentially the same as Semi-Auto Link training with one major difference. That difference is Redriver Semi-Auto Link Training will never change the DP\_TX\_SWING, DP\_PRE\_EMPHASIS, and DP\_POST\_CURSOR2 levels being driven by the SN65DSI86. These settings will always stay fixed to their programmed values. The SN65DSI86 will still send all aux requests to the eDP panel DPCD registers. The redriver will snoop these aux transactions and train the link between it and the eDP panel.

#### 8.4.5.8 Panel Size vs DP Configuration

Table 13 is provided as a guideline of the best DP configuration (datarate and number of lanes) for a specific video resolution and color depth. The preferred (P) setting assumes the eDP panel supports the 5.4 Gbps datarate.

**Table 13. Recommended DP Configuration**

COMMON VIDEO MODE NAME	VESA® TIMING NAME (HORIZONTAL x VERTICAL AT FRAME RATE)	PIXEL CLOCK RATE (MHz)	RGB666				RGB888			
			STREAM BIT RATE (Gbps)	REQUIRED NUMBER OF DP LANES AT			STREAM BIT RATE (Gbps)	REQUIRED NUMBER OF DP LANES AT		
				1.62 Gbps	2.7 Gbps	5.4 Gbps		1.62 Gbps	2.7 Gbps	5.4 Gbps
XGA	1024 x 768 at 60 Hz CVT (reduced blanking)	56	1.01	1 (P)	1	1	1.34	2	1 (P)	1
WXGA	1280 x 768 at 60 Hz CVT (reduced blanking)	68	1.23	1 (P)	1	1	1.64	2	1 (P)	1
WXGA	1280 x 800 at 60 Hz CVT (reduced blanking)	71	1.28	1 (P)	1	1	1.7	2	1 (P)	1
HD	1366 x 768 at 60 Hz	86	1.54	2	1 (P)	1	2.05	2	1 (P)	1
WXGA+	1440 x 900 at 60 Hz CVT (reduced blanking)	89	1.6	2	1 (P)	1	2.13	2	1 (P)	1
SXGA+	1400 x 1050 at 60 Hz CVT (reduced blanking)	101	1.82	2	1 (P)	1	2.42	2	2	1 (P)
HD+	1600 x 900 at 60 Hz (reduced blanking)	108	1.94	2	1 (P)	1	2.59	4	2	1 (P)
WSXGA+	1680 x 1050 at 60 Hz CVT (reduced blanking)	119	2.12	2	1 (P)	1	2.86	4	2	1 (P)
UXGA	1600 x 1200 at 60 Hz CVT (reduced blanking)	130	2.34	2	2	1 (P)	3.13	4	2	1 (P)
FHD	1920 x 1080 at 60 Hz	149	2.67	4	2	1 (P)	3.56	4	2	1 (P)
WUXGA	1920 x 1200 at 60 Hz CVT (reduced blanking)	154	2.77	4	2	1 (P)	3.7	4	2	1 (P)
WQXGA	2560 x 1600 at 60 Hz CVT (reduced blanking)	269	4.83	4	4	2 (P)	6.44	NA	4	2 (P)

#### **8.4.5.9 Panel Self Refresh (PSR)**

The panel self refresh (PSR) feature enables system-level power savings when the displayed image remains static for multiple display frames. The eDP display (sink) stores a static image locally in a remote frame buffer (RFB) within the sink and displays this image from the RFB while the eDP Main link may be turned off (SUSPEND asserted). The SN65DSI86 may turn off other features in addition to the main link for further power savings. The system software makes the determination on what power savings must be implemented (like shutdown of DP link (SUSPEND asserted), shutdown of entire SN65DSI86 (EN deasserted), and so on). When implementing PSR, any power savings must not impact system responsiveness to user input that affects the display, such as cursor movement.

In the list below are the requirements the GPU and system designer must meet when implementing PSR:

1. Updates to the remote frame buffer located in sink must include two of the same static frame. The reason for this requirement is the SN65DSI86 will never pass the first frame received on the DSI interface to the DisplayPort interface. All subsequent frames will be passed to the DisplayPort interface.
2. If PWM signal is controlled directly by the SN65DSI86 and SUSPEND asserted, the REFCLK must remain active.

#### **8.4.5.10 Secondary Data Packet (SDP)**

All secondary data packets (SDP) are provided to the SN65DSI86 through the DSI interface during vertical blanking periods. (SDP are not supported using the I<sup>2</sup>C interface.) The SN65DSI86 will wrap the SDP provided to the DSI interface with the SS and SE control symbols and then transmit over the DP interface during the vertical blanking period. Secondary data packets are used to pass non-active video data to the eDP sink. Information like stereo video attributes and/or PSR-state data is sent using SDP. When SDP is used for stereo video attributes, software must program the MSA\_MISC1\_2\_1 register with a zero.

The SN65DSI86 requires that the SDP be provided to the DSI interface in the following order:

1. 4 Bytes of Header (HB0 through HB3)
2. 4 Bytes of Header parity (PB0 through PB3)
3. 8 Bytes of Data (DB0 through DB7)
4. 2 Bytes of Data parity (PB4 and PB5)
5. 8 Bytes of Data (DB8 through DB15)
6. 2 Bytes of Data parity (PB6 and PB7)

For data payloads greater than 16 bytes, data must be provided in multiples of 8 bytes with of 2 bytes of parity. If the final multiple is less than 8, zero padding must be used to fill the remaining data positions.

#### **8.4.5.11 Color Bar Generator**

The SN65DSI86 implements a SMPTE color bar. The color bar generator does not require the DSI interface. All color bars will be transmitted at a 60-Hz frame rate. The active video size of the Color bar is determined by the values programmed into the Video Registers.

The color bar generator supports the following color bars for both horizontal and vertical direction:

1. 8 color {White, Yellow, Cyan, Green, Magenta, Red, Blue, Black}
2. 8 gray scale {White, Light Gray, Gray, Light Slate Gray, Slate Gray, Dim Gray, Dark Slate Gray, Black}
3. 3 color {Red, Green, Blue}
4. Stripes {White, Black}. Every other pixel (pixel1 = white, pixel2 = black, pixel3 = white, and so on).

**Table 14. 24-bit RGB Color Codes**

COLOR	RED	GREEN	BLUE
Black	0x00	0x00	0x00
Red	0xFF	0x00	0x00
Green	0x00	0xFF	0x00
Blue	0x00	0x00	0xFF
Yellow	0xFF	0xFF	0x00
White	0xFF	0xFF	0xFF
Magenta	0xFF	0x00	0xFF
Cyan	0x00	0xFF	0xFF
Gray	0xBE	0xBE	0xBE
Light Gray	0xD3	0xD3	0xD3
Light Slate Gray	0x77	0x88	0x99
Slate Gray	0x70	0x80	0x90
Dim Gray	0x69	0x69	0x69
Dark Slate Gray	0x2F	0x4F	0x4F

---

**NOTE**

Both VSTREAM\_ENABLE and Color\_Bar\_En must be set in order to transmit Color Bar over DisplayPort interface. Also, ML\_TX\_MODE must be programmed to Normal Mode.

---

**8.4.5.12 DP Pattern**

SN65DSI86 supports the training and compliance patterns mentioned in [Table 15](#). The value of ML\_TX\_MODE register controls what pattern will be transmitted.

**Table 15. DP Training and Compliance Patterns**

PATTERN	[DP] SECTION
IDLE	5.1.3.1
TPS1	Table 3-16 and 2.9.3.6.1
TPS2	Table 3-16
TPS3	Table 3-16
PRBS7	Table 2-75 address 0x00102.
HBR2 Compliance Eye <sup>(1)</sup>	2.9.3.6.5
Symbol Error Rate Measurement <sup>(1)</sup>	2.9.3.6.2 and 2.10.4
80 bit Customer Pattern	2.9.3.6.4

- (1) HBR2 Compliance Eye and Symbol Error Rate Measurement require TEST2 pin to be pulled up before the assertion of EN and software program a 1 to bit 0 of offset 0x16 at Page 7 followed by a write of 0 to bit 0 of offset 0x5A at Page 0 before writing either a 0x6 or 0x7 to ML\_TX\_MODE register.

**8.4.5.12.1 HBR2 Compliance Eye**

When the ML\_TX\_MODE is set to HBR2 Compliance Eye, the SN65DSI86 will use the value programmed into the HBR2\_COMPEYEPAT\_LENGTH register to determine the number of scrambled 0 before transmitting an Enhanced Frame Scrambler Reset sequence. The Enhanced Framing Scrambler Reset sequence used is determined by ENCH\_FRAME\_PATT register.

**Table 16. Common 80-bit Custom Patterns**

Byte#	PLTPAT	PCTPAT
0	0x1F	0x1F
1	0x7C	0x7C
2	0xF0	0xF0
3	0xC1	0xC1
4	0x07	0xCC
5	0x1F	0xCC
6	0x7C	0xCC
7	0xF0	0x4C
8	0xC1	0x55
9	0x07	0x55

#### 8.4.5.12.2 80-Bit Custom Pattern

The 80-bit Custom pattern is used for generating the Post Cursor2 Test Pattern (PCTPAT) and the Pre-Emphasis Level Test Pattern (PLTPAT). The SN65DSI86 will continuously transmit the value programmed into the *80BIT\_CUSTOM\_PATTERN* registers when the *ML\_TX\_MODE* is programmed to 80-bit Custom Pattern. The SN65DSI86 will always transmit over the enabled DisplayPort Lanes the LSB of the byte first and the MSB of the byte last. The byte at the lowest address is transmitted first.

#### 8.4.5.13 BPP Conversion

The SN65DSI86 transmits either 18bpp or 24bpp over the DisplayPort interface based on the *DP\_18BPP\_EN* bit. When this bit is cleared and 18 bpp is being received on DSI interface, the SN65DSI86 performs the following translation of the 18 bpp into 24 bpp:  $\text{new}[7:0] = \{\text{original}[5:0], \text{original}[5:4]\}$ . When the *DP\_18BPP\_EN* bit is set and 24 bpp is being received on DSI interface, the SN65DSI86 performs the following translation of 24 bpp to 18 bpp:  $\text{new}[5:0] = \text{original}[7:2]$ .

## 8.5 Programming

### 8.5.1 Local I<sup>2</sup>C Interface Overview

The SN65DSI86 local I<sup>2</sup>C interface is enabled when *EN* is input high, access to the CSR registers is supported during ultra-low power state (ULPS). The *SCL* and *SDA* terminals are used for I<sup>2</sup>C clock and I<sup>2</sup>C data, respectively. The SN65DSI86 I<sup>2</sup>C interface conforms to the two-wire serial interface defined by the I<sup>2</sup>C Bus Specification, Version 2.1 (January 2000), and supports fast mode transfers up to 400 kbps.

The device address byte is the first byte received following the START condition from the master device. The 7-bit device address for SN65DSI86 is factory preset to 010110X with the least significant bit being determined by the *ADDR* control input. Table 17 clarifies the SN65DSI86 target address.

**Table 17. SN65DSI86 I<sup>2</sup>C Target Address Description**

SN65DSI86 I <sup>2</sup> C TARGET ADDRESS							
Bit 7 (MSB)	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0 (W/R)
0	1	0	1	1	0	ADDR	0/1
When ADDR = 1, Address Cycle is 0x5A (Write) and 0x5B (Read) When ADDR = 0, Address Cycle is 0x58 (Write) and 0x59 (Read)							

The following procedure is followed to write to the SN65DSI86 I<sup>2</sup>C registers:

1. The master initiates a write operation by generating a start condition (S), followed by the SN65DSI86 7-bit address and a zero-value W/R bit to indicate a write cycle.
2. The master presents the subaddress (I<sup>2</sup>C register within SN65DSI86) to be written, consisting of one byte of data, MSB-first.
3. The master presents the subaddress (I<sup>2</sup>C register within SN65DSI86) to be written, consisting of one byte of data, MSB-first.
4. The SN65DSI86 acknowledges the subaddress cycle.

5. The master presents the first byte of data to be written to the I<sup>2</sup>C register.
6. The SN65DSI86 acknowledges the byte transfer.
7. The master terminates the write operation by generating a stop condition (P).
8. The master terminates the write operation by generating a stop condition (P).

The following procedure is followed to read the SN65DSI86 I<sup>2</sup>C registers:

1. The master initiates a read operation by generating a start condition (S), followed by the SN65DSI86 7-bit address and a one-value W/R bit to indicate a read cycle.
2. The SN65DSI86 acknowledges the address cycle.
3. The SN65DSI86 transmit the contents of the memory registers MSB-first starting at register 00h or last read subaddress+1. If a write to the SN65DSI86 I<sup>2</sup>C register occurred prior to the read, then the SN65DSI86 will start at the subaddress specified in the write.
4. The SN65DSI86 will wait for either an acknowledge (ACK) or a not-acknowledge (NACK) from the master after each byte transfer; the I<sup>2</sup>C master acknowledges reception of each data byte transfer.
5. If an ACK is received, the SN65DSI86 transmits the next byte of data.
6. The master terminates the read operation by generating a stop condition (P).

The following procedure is followed for setting a starting subaddress for I<sup>2</sup>C reads:

1. The master initiates a write operation by generating a start condition (S), followed by the SN65DSI86 7-bit address and a zero-value W/R bit to indicate a write cycle.
2. The SN65DSI86 acknowledges the address cycle.
3. The master presents the subaddress (I<sup>2</sup>C register within SN65DSI86) to be written, consisting of one byte of data, MSB-first.
4. The SN65DSI86 acknowledges the subaddress cycle.
5. The master terminates the write operation by generating a stop condition (P).

---

#### NOTE

If no subaddressing is included for the read procedure, then reads start at register offset 00h and continue byte by byte through the registers until the I<sup>2</sup>C master terminates the read operation. If a I<sup>2</sup>C write occurred prior to the read, then the reads start at the subaddress specified by the write.

---

## 8.6 Register Map

Many of the SN65DSI86 functions are controlled by the Control and Status Registers (CSR). All CSR registers are accessible through the local I<sup>2</sup>C interface or through DSI interface.

Reads from reserved fields not described return zeros, and writes to read-only reserved registers are ignored. Writes to reserved register which are marked with W will produce unexpected behavior.

**Table 18. Bit Field Access Tag Descriptions**

ACCESS TAG	NAME	MEANING
R	Read	The field may be read by software
W	Write	The field may be written by software
S	Set	The field may be set by a write of one. Writes of zeros to the field have no effect.
C	Clear	The field may be cleared by a write of one. Writes of zero to the field have no effect.
U	Update	Hardware may autonomously update this field.
NA	No Access	Not accessible or not applicable

Figure 19. Register Map

8.6.1 Standard CFR Registers (PAGE 0)

Table 19. CSR Bit Field Definitions—ID Registers

ADDRESS	BIT(S)	DESCRIPTION	ACCESS
0x00 through 0x07	7:0	DEVICE_ID For the SN65DSI86 these fields return a string of ASCII characters returning DSI86 preceded by three space characters. Addresses 0x07 through 0x00 = {0x20, 0x20, 0x20, 0x44, 0x53, 0x49, 0x38, 0x36}	R
0x08	7:0	DEVICE_REV Device revision; returns 0x02.	

Table 20. CSR Bit Field Definitions—Reset and Clock Registers

ADDRESS	BIT(S)	DESCRIPTION	ACCESS	
0x09	0	SOFT_RESET This bit automatically clears when set to 1 and returns zeros when read. This bit must be set after the CSRs are updated. This bit must also be set after making any changes to the DIS clock rate or after changing between DSI burst and non-burst modes. 0 = No action (default) 1 = Reset device to default condition excluding the CSR bits.	W	
0x0A	7	DP_PLL_LOCK 0 = DP_PLL not locked (default) 1 = DP_PLL locked	R	
	6:4	Reserved	R	
	3:1	REFCLK_FREQ. This field is used to control the clock source and frequency select inputs to the DP PLL. Any change in this field will cause the DP PLL to reacquire lock. On the rising edge of EN the SN65DSI86 will sample the state of GPIO[3:1] as well as detect the presence or absence of a clock on REFCLK pin. The outcome will determine whether the clock source for the DP PLL is from the REFCLK pin or the DSIA CLK. The outcome will also determine the frequency of the clock source.		RWU
		DPPLL_CLK_SRC = 0	DPPLL_CLK_SRC = 1	
0	000 = 12 MHz 001 = 19.2 MHz (Default) 010 = 26 MHz 011 = 27 MHz 100 = 38.4 MHz All other combinations are 19.2 MHz		RU	
000 = Continuous DSIA CLK at 468 MHz 001 = Continuous DSIA CLK at 384 MHz 010 = Continuous DSIA CLK at 416 MHz 011 = Continuous DSIA CLK at 486 MHz 100 = Continuous DSIA CLK at 460.8 MHz All other combinations are DSIA CLK at 384 MHz.				
DPPLL_CLK_SRC. This status field indicates the outcome of the clock detection on the REFCLK pin. 0 = Clock detected on REFCLK pin. DP_PLL clock derived from input REFCLK (default). 1 = No clock detected on REFCLK pin. DP_PLL clock derived from MIPI D-PHY channel A HS continuous clock

**Table 21. CSR Bit Field Definitions—DSI Registers (continued)**

ADDRESS	BIT(S)	DESCRIPTION	ACCESS
0x12	7:0	<p><b>CHA_DSI_CLK_RANGE</b> This field specifies the DSI clock frequency range in 5-MHz increments for DSI Channel A clock. The SN65DSI866 estimates the DSI clock frequency using the REFCLK frequency determined at the rising edge of EN and updates this field accordingly. Software can override this value. If the CHA_DSI_CLK_RANGE is not loaded before receiving the first DSI packet, the SN65DSI86 uses the first packet to estimate the DSI_CLK frequency and loads this field with this estimate. This first packet may not be received; thus, the host should send a first dummy packet (such as DSI read or write to register 0x00). This field may be written by the host at any time. Any non-zero value written by the host is used instead of the automatically-estimated value.</p> <p>0x00 through 0x07: Reserved            0x08 = 40 ≤ frequency &lt; 45 MHz            0x09 = 45 ≤ frequency &lt; 50 MHz            . . .            0x96 = 750 ≤ frequency &lt; 755 MHz            0x97 through 0xFF: Reserved</p>	RWU
0x13	7:0	<p><b>CHB_DSI_CLK_RANGE</b> This field specifies the DSI clock frequency range in 5-MHz increments for DSI Channel B clock. The SN65DSI86 estimates the DSI clock frequency using the REFCLK frequency determined at the rising edge of EN and updates this field accordingly. Software can override this value. If the CHB_DSI_CLK_RANGE is not loaded before receiving the first DSI packet, the SN65DSI86 uses the first packet to estimate the DSI_CLK frequency and loads this field with this estimate. This first packet may not be received; thus, the host should send a first dummy packet (such as DSI read or write to register 0x00). This field may be written by the host at any time. Any non-zero value written by the host is used instead of the automatically-estimated value.</p> <p>0x00 through 0x07: Reserved            0x08 = 40 ≤ frequency &lt; 45 MHz            0x09 = 45 ≤ frequency &lt; 50 MHz            . . .            0x96 = 750 ≤ frequency &lt; 755 MHz            0x97 through 0xFF: Reserved</p>	RWU

RWU
0	ADJUST_REQUEST_DISABLE. This field is used during Semi-Auto Link training. 0 = SN65DSI86 will read from DPCD address to determine next training level (pre-emphasis, tx swing level, and post-cursor2). (Default) 1 = SN65DSI86 will not read from DPCD address to determine next training level. It will instead go to next available Pre-emphasis level. After maximum pre-emphasis level has been reached, the SN65DSI86 will attempt next DP_TX_SWING and reset pre-emphasis level back to level 0. Post-Cursor2 is not used in this mode.	RW	
0x96	3:0	ML_TX_MODE 0000 = Main Link Off (default) 0001 = Normal mode (Idle pattern or active video) 0010 = TPS1 0011 = TPS2 0100 = TPS3 0101 = PRBS7 0110 = HBR2 Compliance Eye Pattern 0111 = Symbol Error Rate Measurement Pattern 1000 = 80-bit Custom Pattern 1001 = Fast Link Training 1010 = Semi-Auto Link Training. 1011 = Redriver Semi-Auto Link Training All others are Reserved.	RWU
0x97	7:0	HBR2_COMPEYEPAT_LENGTH_LOW. This field is the count of number of scrambled 0 symbols to be output for every Enhanced Framing Scrambler Reset sequence. This count includes the reset sequence. A value less than four causes scrambled 0 symbols to be output with no scrambler reset sequence. This field represents the lower 8 bits of the 16-bit HBR2_COMPEYEPAT_LENGTH register. This field defaults to 0x04.	RW
0x98	7:0	HBR2_COMPEYEPAT_LENGTH_HIGH. This field is the count of number of scrambled 0 symbols to be output for every Enhanced Framing Scrambler Reset sequence. This count includes the reset sequence. A value less than four causes scrambled 0 symbols to be output with no scrambler reset sequence. This field represents the upper 8 bits of the 16-bit HBR2_COMPEYEPAT_LENGTH register. This field defaults to 0x01.	RW
0x99	7	LINK_RATE_SET_EN. When this field is cleared, the Semi-Auto Link training will write the appropriate value (0x06 for 1.62 Gbps, 0x0A for 2.7 Gbps, or 0x14 for 5.4 Gbps) to the sink LINK_RATE_SET register at DPCD address 0x00110. When this field is set, the Semi-Auto Link Training will write the value in the LINK_RATE_SET field to the sink LINK_RATE_SET register at DPCD address 0x00115. Defaults to 0.	RW
	2:0	LINK_RATE_SET. When LINK_RATE_SET_EN bit is set, the value in this field will be written to the sink LINK_RATE_SET register at DPCD address 0x00115 during Semi-Auto Link training process. Defaults to 0x0.	RW

**Table 27. CSR Bit Field Definitions—PWM Registers**

ADDRESS	BIT(S)	DESCRIPTION	ACCESS
0xA0	7:0	PWM_PRE_DIV The value programmed into this field along with the value in BACKLIGHT_SCALE is used to set the PWM frequency. The PWM frequency = REFCLK / (PWM_PRE_DIV × BACKLIGHT_SCALE + 1). This field defaults to 0x01.	RW
0xA1	7:0	BACKLIGHT_SCALE_LOW. The digital value corresponding to the maximum possible backlight input value. Default to 0xFF. The value in this field is the lower 8 bits of the 16-bit BACKLIGHT_SCALE register.	RW
0xA2	7:0	BACKLIGHT_SCALE_HIGH. The digital value corresponding to the maximum possible backlight input value. Default to 0xFF. The value in this field is the upper 8 bits of the 16-bit BACKLIGHT scale register.	RW
0xA3	7:0	BACKLIGHT_LOW Screen brightness on a scale of 0 to BACKLIGHT_SCALE. The value in this field is the lower 8 bits of the 16-bit BACKLIGHT register. Defaults to 0x00	RW
0xA4	7:0	BACKLIGHT_HIGH Screen brightness on a scale of 0 to BACKLIGHT_SCALE. The value in this field is the upper 8 bits of the 16-bit BACKLIGHT register. Default to 0x00. The SN65DSI86 will latch the 16-bit BACKLIGHT value on a write to this field.	RW
0xA5	1	PWM_EN. 0 = PWM is disabled. (Default). 1 = PWM enabled.	RW
	0	PWM_INV. When this bit is set, the PWM output will be inverted. 0 = Normal (default) 1 = Inverted.	RW

**Table 28. CSR Bit Field Definitions—DP Link Training LUT**

ADDRESS	BIT(S)	DESCRIPTION	ACCESS
0xB0	7:4	V0_P0_PRE. This field contains the post1 pre-emphasis code, where the pre-emphasis setting is given by $PREdB = -20 \times \text{LOG}(1 - 0.05 \times V0\_P0\_PRE)$ (in dB), when the DP_TX_SWING = Level 0 and DP_PRE_EMPHASIS = Level 0 are select by the training algorithm. The default value for this field is 0 (0 dB).	RW
	3:0	V0_P0_VOD. This field contains the TX swing code, where the emphasized output pk-pk differential voltage is given by $VOD = 200 + 50 \times V0\_P0\_VOD$ (in mV), when the DP_TX_SWING = Level 0 and DP_PRE_EMPHASIS = Level 0 are selected by the training algorithm. The maximum supported value is 12 (800 mV). Any value greater than 12 is reserved for SN65DSI86. The default value for this field is 4 (400 mV).	RW
0xB1	7:4	V0_P1_PRE. This field contains the post1 pre-emphasis code, where the pre-emphasis setting is given by $PREdB = -20 \times \text{LOG}(1 - 0.05 \times V0\_P1\_PRE)$ (in dB), when the DP_TX_SWING = Level 0 and DP_PRE_EMPHASIS = Level 1 are select by the training algorithm. The default value for this field is 7 (3.74 dB).	RW
	3:0	V0_P1_VOD. This field contains the TX swing code, where the emphasized output pk-pk differential voltage is given by $VOD = 200 + 50 \times V0\_P1\_VOD$ (in mV), when the DP_TX_SWING = Level 0 and DP_PRE_EMPHASIS = Level 1 are selected by the training algorithm. The maximum supported value is 12 (800 mV). Any value greater than 12 is reserved for SN65DSI86. The default value for this field is 8 (600 mV).	RW
0xB2	7:4	V0_P2_PRE. This field contains the post1 pre-emphasis code, where the pre-emphasis setting is given by $PREdB = -20 \times \text{LOG}(1 - 0.05 \times V0\_P2\_PRE)$ (in dB), when the DP_TX_SWING = Level 0 and DP_PRE_EMPHASIS = Level 2 are select by the training algorithm. The default value for this field is 10 (6.02 dB).	RW
	3:0	V0_P2_VOD. This field contains the TX swing code, where the emphasized output pk-pk differential voltage is given by $VOD = 200 + 50 \times V0\_P2\_VOD$ (in mV), when the DP_TX_SWING = Level 0 and DP_PRE_EMPHASIS = Level 2 are selected by the training algorithm. The maximum supported value is 12 (800 mV). Any value greater than 12 is reserved for SN65DSI86. The default value for this field is 12 (800 mV).	RW

0x16	0	ASSR_OVERRIDE. 0 = ASSR_CONTROL is read-only. (Default) 1 = ASSR_CONTROL is read/write.	RW

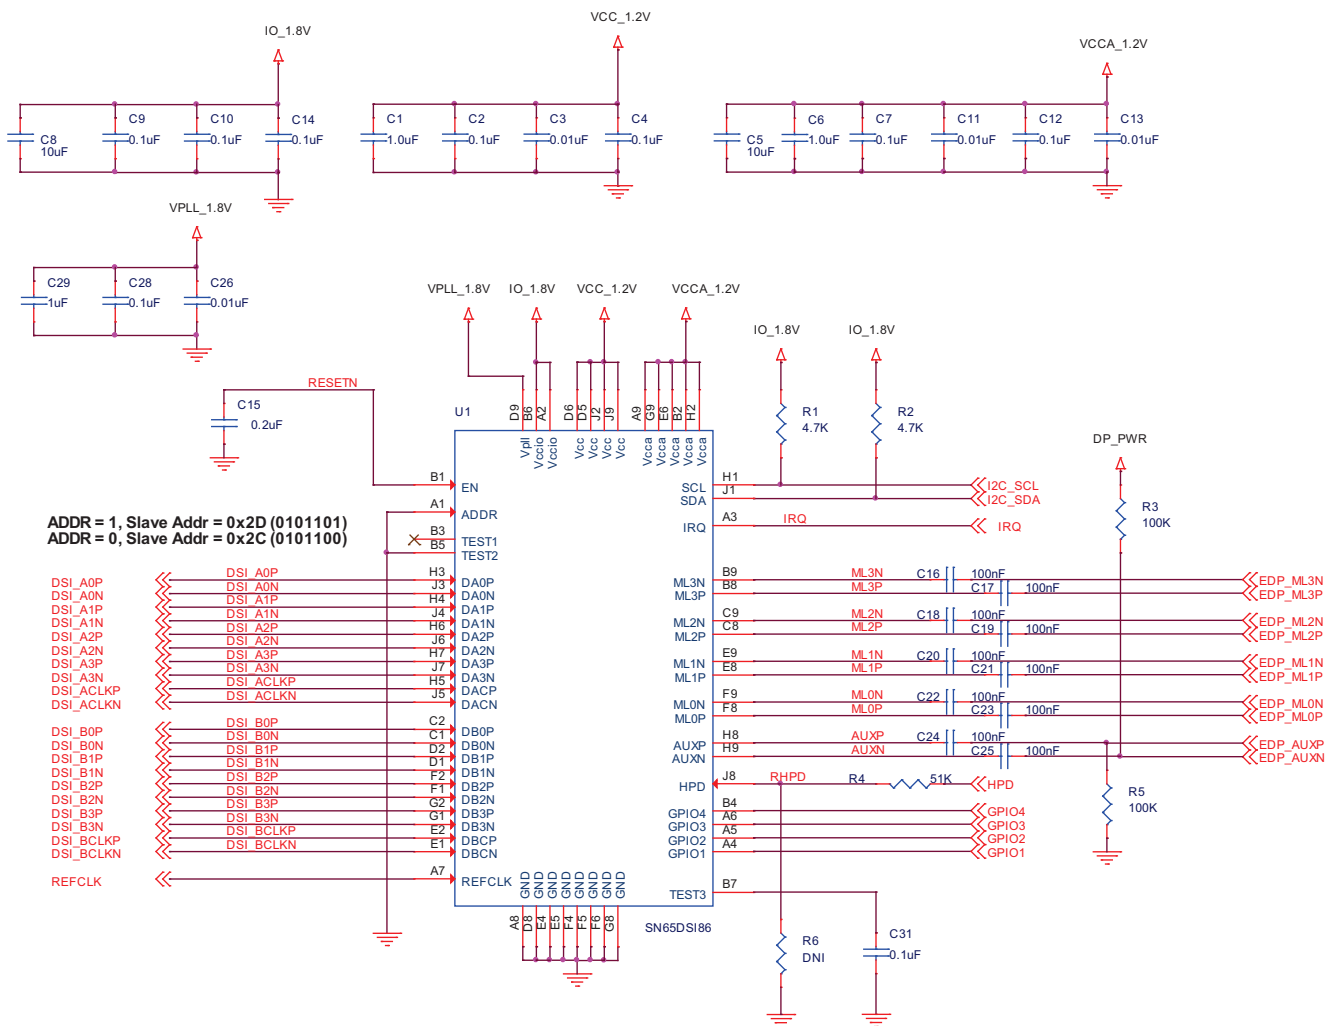

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality

### 9.1 Application Information

The SN65DSI86 is a bridge which interfaces DSI to embedded DisplayPort (eDP). Because it does not support HDCP, it is only intended for internal applications like notebooks and tablets. Four lanes of HBR2 (17.28 Gbps before 8b10b encoding) and dual DSI input (up to 8 lanes at 1.5 Gbps for a total of 12 Gbps) allows the SN65DSI86 to support large high resolution eDP panels.

**Figure 20. Typical Implementation**

## 9.2 Typical Application

### 9.2.1 1080p (1920x1080 60 Hz) Panel

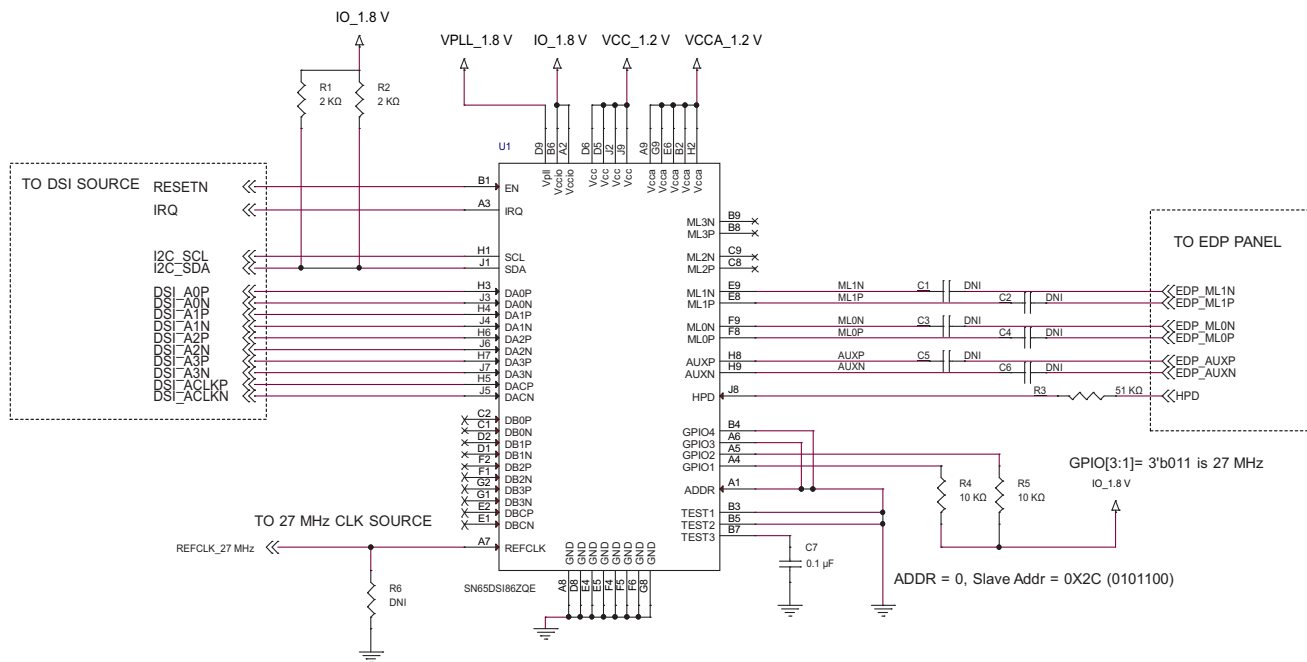

Figure 21. 1080p (1920 × 1080 60 Hz) Panel

#### 9.2.1.1 Design Requirements

For this design example, use the parameters listed in Table 34.

Table 34. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
V <sub>CC</sub> and V <sub>CCA</sub> Supply	1.2 V (± 5%)
V <sub>CCIO</sub> Supply	1.8 V (± 10%)
V <sub>PLL</sub> Supply	1.8 V (± 10%)
Clock Source (REFCLK or DSIA_CLK)	REFCLK
REFCLK Frequency (12 MHz, 19.2 MHz, 26 MHz, 27 MHz, or 38.4 MHz)	27 MHz
DSIA Clock Frequency	N/A
<b>eDP PANEL EDID RESOLUTION INFORMATION</b>	
Pixel Clock (MHz)	148.5
Horizontal Active (pixels)	1920
Horizontal Blanking (pixels)	280
Vertical Active (lines)	1080
Vertical Blanking (lines)	45
Horizontal Sync Offset (pixels)	88
Horizontal Sync Pulse Width (pixels)	44
Vertical Sync Offset (lines)	4
Vertical Sync Pulse Width (lines)	5
Horizontal Sync Pulse Polarity	Positive
Vertical Sync Pulse Polarity	Positive
Color Bit Depth (6 bpc or 8 bpc)	8 (24 bpp)

## Typical Application (continued)

**Table 34. Design Parameters (continued)**

DESIGN PARAMETER	EXAMPLE VALUE
<b>eDP PANEL DPCD INFORMATION</b>	
eDP Version (1.0, 1.1, 1.2, 1.3, or 1.4)	1.3
Number of eDP lanes (1, 2, or 4)	2
Datarate Supported (1.62 Gbps, 2.16 Gbps, 2.43 Gbps, 2.70 Gbps, 3.24 Gbps, 4.32 Gbps, or 5.40 Gbps)	2.70
<b>DSI INFORMATION</b>	
APU or GPU Maximum number of DSI Lanes (1 through 8)	4
APU or GPU Maximum DSI Clock Frequency (MHz)	500
Single or Dual DSI	Single
Dual DSI Configuration (Odd/Even or Left/Right)	NA

### 9.2.1.2 Detailed Design Procedure

#### 9.2.1.2.1 eDP Design Procedure

The panel, as indicated by the panel EDID information, supports a pixel clock of 148.5 MHz at 8 bpc or 24 bpp. This translates to a stream bit rate of 3.564 Gbps.

$$\text{Stream Bit Rate} = \text{PixelClock} \times \text{bpp}$$

$$\text{Stream Bit Rate} = 148.5 \times 24$$

$$\text{Stream Bit Rate} = 3.564 \text{ Gbps}$$

In order to support the panel stream bit rate, the SN65DSI86 eDP interface must be programmed so that the total eDP data rate is greater than the stream bit rate. In this example, the total eDP data rate is calculated as:

$$\text{eDP Total Bit Rate} = \#\_of\_eDP\_Lanes \times \text{DataRate} \times 0.80$$

$$\text{eDP Total Bit Rate} = 2 \times 2.7 \text{ Gbps} \times 0.80$$

$$\text{eDP Total Bit Rate} = 4.32 \text{ Gbps.}$$

In this example, the eDP panel DPCD registers indicates eDP1.3 compliant, supports a data rate of 2.7 Gbps per lane, and a lane count of 2. For this panel to operate properly, the SN65DSI86 would need to be programmed to enable two lanes at a data rate of 2.7 Gbps each.

In portable and mobile applications, total power consumption is a key care-about. In this example, the panel chosen is eDP 1.3 compliant and supports a data rate of 2.7 Gbps per lane. The SN65DSI86 power consumption is a function of the data rate and number of active DP lanes. By reducing the number of active lanes and/or data rate, the total power consumption of the SN65DSI86 is reduced as well. If a panel which supported data rate of 5.4 Gbps was chosen over the example panel, the number of lanes could be reduced from two lanes to one lane. Or if a panel which was eDP1.4 compliant and support 2.43 Gbps data rate was chosen over the example panel, the data rate could be reduced from 2.7 Gbps to 2.43 Gbps.

Once the eDP interface parameters are known, the video resolution parameters required by the panel need to be programmed into the SN65DSI86. For this example, the parameters programmed would be the following:

$$\text{Horizontal Active} = 1920 \text{ or } 0x780$$

$$\text{CHA\_ACTIVE\_LINE\_LENGTH\_LOW} = 0x80$$

$$\text{CHA\_ACTIVE\_LINE\_LENGTH\_HIGH} = 0x07$$

$$\text{Vertical Active} = 1080 \text{ or } 0x438$$

$$\text{CHA\_VERTICAL\_DISPLAY\_SIZE\_LOW} = 0x38$$

$$\text{CHA\_VERTICAL\_DISPLAY\_SIZE\_HIGH} = 0x04$$

$$\text{Horizontal Pulse Width} = 44 \text{ or } 0x2C$$

$$\text{HORIZONTAL\_PULSE\_WIDTH\_LOW} = 0x2C$$

$$\text{HORIZONTAL\_PULSE\_WIDTH\_HIGH} = 0x00$$

$$\text{Vertical Pulse Width} = 5$$

$$\text{VERTICAL\_PULSE\_WIDTH\_LOW} = 0x05$$

$$\text{VERTICAL\_PULSE\_WIDTH\_HIGH} = 0x00$$

$$\text{Horizontal Backporch} = \text{HorizontalBlanking} - (\text{HorizontalSyncOffset} + \text{HorizontalSyncPulseWidth})$$

$$\text{Horizontal Backporch} = 280 - (88 + 44)$$

$$\text{CHA\_HORIZONTAL\_BACK\_PORCH} = 0x94$$

$$\text{Horizontal Backporch} = 148 \text{ or } 0x94$$

$$\text{Vertical Backporch} = \text{VerticalBlanking} - (\text{VerticalSyncOffset} + \text{VerticalSyncPulseWidth})$$

$$\text{Vertical Backporch} = 45 - (4 + 5)$$

$$\text{Vertical Backporch} = 36 \text{ or } 0x24$$

$$\text{CHA\_VERTICAL\_BACK\_PORCH} = 0x24$$

$$\text{Horizontal Frontporch} = \text{HorizontalSyncOffset}$$

$$\text{Horizontal Frontporch} = 88 \text{ or } 0x58$$

$$\text{CHA\_HORIZONTAL\_FRONT\_PORCH} = 0x58$$

$$\text{Vertical Frontporch} = \text{VerticalSyncOffset}$$

$$\text{Vertical Frontporch} = 4$$

$$\text{CHA\_VERTICAL\_FRONT\_PORCH} = 0x04$$

#### 9.2.1.2.2 DSI Design Procedure

The APU or GPU must provide a stream bit rate as required by the eDP panel. In this particular example, the eDP panel stream rate is 3.564 Gbps. Because the SN65DSI86 can support a DSI clock rate of up to 750 MHz (or 1.5 Gbps), the minimum number of required DSI lanes to meet the stream bit rate is three lanes. But in this example, the APU/GPU maximum DSI Clock frequency is 500 MHz. This means the number of required DSI lanes will need to be increased to four lanes.

$$\text{Min number of DSI Lanes} = \text{StreamBitRate} / \text{MaxDSIClock}$$

$$\text{Min number of DSI Lanes} = 3564 \text{ MBps} / (500 \times 2)$$

$$\text{Min number of DSI Lanes} = 3.564 \text{ lanes}$$

$$\text{Min number of DSI Lanes} = 4 \text{ lanes}$$

After determining the number of required DSI lanes, the next step is to determine the minimum required DSI clock frequency to support the stream bit rate of the eDP panel. For 24 bpp, the calculation for determining the DSI clock frequency is as follows:

Min Required DSI Clock Frequency = StreamBitRate /  
(Min\_Number\_DSI\_Lanes × 2)

Min Required DSI Clock Frequency = 3564 / (4 × 2)

Min Required DSI Clock Frequency = 445.5 MHz

In this example, the clock source for the SN65DSI86 is the REFCLK pin. When using the REFCLK as the clock source, any DSI Clock frequency is supported. But if the clock source was instead the DSI A clock, then the required DSI Clock frequency would need to change to a frequency supported by the SN65DSI86. When operating in this mode, any one of the following DSI A clock frequencies can be used: 384 MHz, 416 MHz, 460.8 MHz, 468 MHz, or 486 MHz. In most cases, a eDP panel would support some variation from the ideal pixel clock frequency. For this example either 416 MHz or 460.8 MHz could be tried.

The DSI mode, number of lanes, and DSI Clock frequency needs to be programmed into the SN65DSI86.

DSI\_CHANNEL\_MODE = 1 (Single DSI Channel)

CHA\_DSI\_LANES = 3 (for 4 lanes)

CHA\_DSI\_CLK\_RANGE = 0x59 (equates to 445 MHz)

REFCLK\_FREQ = 0x06 (27 MHz)

### 9.2.1.2.3 Example Script

This example configures the SN65DSI86 for the following configuration:

```

<aardvark>
<configure i2c="1" spi="1" gpio="0" tpower="1" pullups="0" />
<i2c_bitrate khz="100" />

**9.2.1.3 Application Curve**

**Figure 22. HBR Eye Diagram**

## 10 Power Supply Recommendations

### 10.1 $V_{CC}$ Power Supply

Each  $V_{CC}$  power supply pin should have a 100-nF capacitor to ground connected as close as possible to SN65DSI86. TI recommends to have one bulk capacitor (1  $\mu$ F to 10  $\mu$ F) on it. TI recommends to have the pins connected to a solid power plane

### 10.2 $V_{CCA}$ Power supply

Each  $V_{CCA}$  power supply pin should have a 100-nF capacitor to ground connected as close as possible to SN65DSI86. TI recommends to have one bulk capacitor (1  $\mu$ F to 10  $\mu$ F) on it. TI recommends to have the pins connected to a solid power plane.

### 10.3 $V_{PLL}$ and $V_{CCIO}$ Power Supplies

The  $V_{PLL}$  and  $V_{CCIO}$  pins can be tied together or isolated. Regardless of how these two supplies are connected, a 100-nF capacitor to ground should be placed as close as possible to each power pin. TI recommends to have a bulk capacitor (1  $\mu$ F) near the  $V_{PLL}$  pin.

## 11 Layout

### 11.1 Layout Guidelines

To minimize the power supply noise floor, provide good decoupling near the SN65DSI86 power pins. The use of four ceramic capacitors (2 × 0.1 μF and 2 × 0.1 μF) provides good performance. At the very least, TI recommends to install one 0.1-μF and one 0.01-μF capacitors near the SN65DSI86. To avoid large current loops and trace inductance, the trace length between decoupling capacitor and device power inputs pins must be minimized. Placing the capacitor underneath the SN65DSI86 on the bottom of the PCB is often a good choice.

Note: The power supplies  $V_{PLL}$ ,  $V_{CCIO}$ ,  $V_{CCA}$ , and  $V_{CC}$  can be applied simultaneously.

#### 11.1.1 DSI Guidelines

1. DA\*P/N and DB\*P/N pairs should be routed with controlled 100-Ω differential impedance ( $\pm 20\%$ ) or 50-Ω single-ended impedance ( $\pm 15\%$ ).
2. Keep away from other high speed signals.
3. Keep lengths to within 5 mils of each other.
4. Length matching should be near the location of mismatch. See Figure 4 for an example.
5. Each pair should be separated at least by 3 times the signal trace width.
6. The use of bends in differential traces should be kept to a minimum. When bends are used, the number of left and right bends should be as equal as possible and the angle of the bend should be  $\geq 135^\circ$ . This arrangement minimizes any length mismatch caused by the bends and therefore minimizes the impact that bends have on EMI.
7. Route all differential pairs on the same of layer.
8. The number of VIAS should be kept to a minimum. TI recommends to keep the VIAS count to 2 or less.
9. Keep traces on layers adjacent to ground plane.
10. Do NOT route differential pairs over any plane split.
11. Adding Test points will cause impedance discontinuity and will therefore negatively impact signal performance. If test points are used, they should be placed in series and symmetrically. They must not be placed in a manner that causes a stub on the differential pair.
12. The maximum trace length over FR4 between SN65DSI86 and the GPU is 25 to 30 cm.

#### 11.1.2 eDP Guidelines

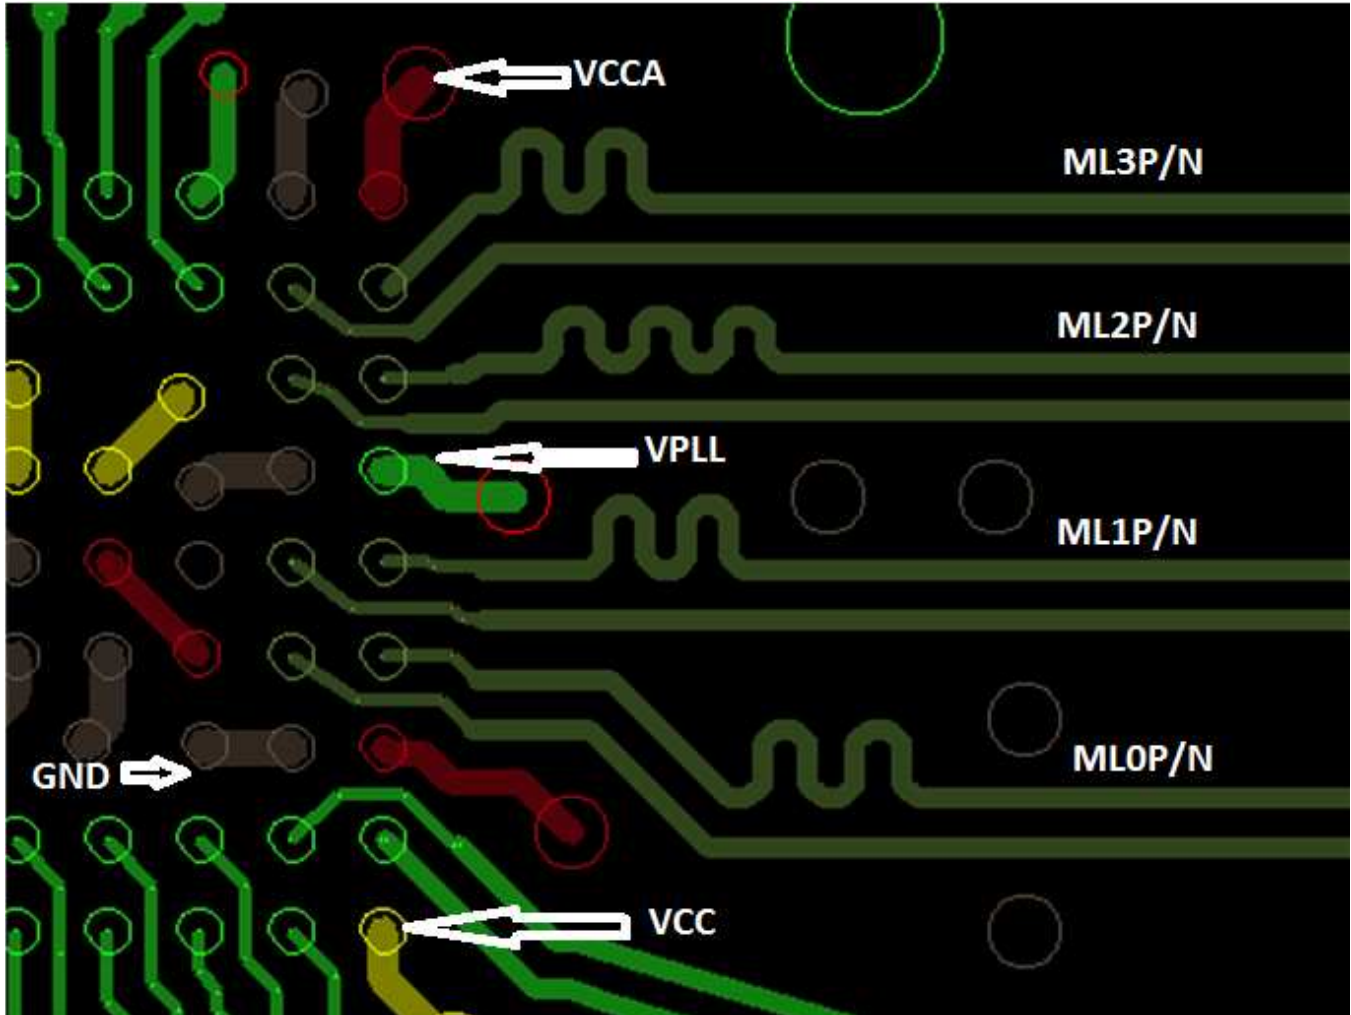

1. ML\*P/N pairs should be routed with controlled 100-Ω differential impedance ( $\pm 20\%$ ) or 50-Ω single-ended impedance ( $\pm 15\%$ ).
2. Keep away from other high speed signals.
3. Keep lengths to within 5 mils of each other.
4. Length matching should be near the location of mismatch. See Figure 4 for an example.
5. Each pair should be separated at least by 3 times the signal trace width.
6. The use of bends in differential traces should be kept to a minimum. When bends are used, the number of left and right bends should be as equal as possible and the angle of the bend should be  $\geq 135^\circ$ . This arrangement minimizes any length mismatch caused by the bends and therefore minimizes the impact that bends have on EMI.
7. Route all differential pairs on the same of layer.
8. The number of VIAS should be kept to a minimum. TI recommends to keep the VIAS count to 2 or less.
9. Keep traces on layers adjacent to ground plane.
10. Do NOT route differential pairs over any plane split.
11. Adding Test points will cause impedance discontinuity and will therefore negatively impact signal performance. If test points are used, they should be placed in series and symmetrically. They must not be placed in a manner that causes a stub on the differential pair.
12. The maximum trace length over FR4 between SN65DSI86 and the eDP receptacle is 4 inches for data rates less than or equal to HBR (2.7 Gbps) and 2 inches for HBR2 (5.4 Gbps).

## Layout Guidelines (continued)

### 11.1.3 Ground

TI recommends that only one board ground plane be used in the design. This provides the best image plane for signal traces running above the plane. The thermal pad of the SN65DSI86 should be connected to this plane with vias.

### 11.2 Layout Example

## 13 机械、封装和可订购信息

以下页中包括机械、封装和可订购信息。这些信息是针对指定器件可提供的最新数据。这些数据会在无通知且不对本文档进行修订的情况下发生改变。欲获得该数据表的浏览器版本，请查阅左侧的导航栏。

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
SN65DSI86ZQER	ACTIVE	BGA MICROSTAR JUNIOR	ZQE	64	2500	Green (RoHS & no Sb/Br)	SNAGCU	Level-3-260C-168 HR	-40 to 85	DSI86	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. ## 重要声明

德州仪器 (TI) 公司有权按照最新发布的 JESD46 对其半导体产品和服务进行纠正、增强、改进和其他修改，并不再按最新发布的 JESD48 提供任何产品和服务。买方在下订单前应获取最新的相关信息，并验证这些信息是否完整且是最新的。

TI 公布的半导体产品销售条款 (<http://www.ti.com/sc/docs/stdterms.htm>) 适用于 TI 已认证和批准上市的已封装集成电路产品的销售。另有其他条款可能适用于其他类型 TI 产品及服务的使用或销售。

复制 TI 数据表上 TI 信息的重要部分时，不得变更该等信息，且必须随附所有相关保证、条件、限制和通知，否则不得复制。TI 对该等复制文件不承担任何责任。第三方信息可能受到其它限制条件的制约。在转售 TI 产品或服务时，如果存在对产品或服务参数的虚假陈述，则会失去相关 TI 产品或服务的明示或暗示保证，且构成不公平的、欺诈性商业行为。TI 对此类虚假陈述不承担任何责任。

买方和在系统中整合 TI 产品的其他开发人员（总称“设计人员”）理解并同意，设计人员在设计应用时应自行实施独立的分析、评价和判断，且应全权负责并确保应用的安全性，及设计人员的应用（包括应用中使用的 TI 产品）应符合所有适用的法律法规及其他相关要求。设计人员就自己设计的应用声明，其具备制订和实施下列保障措施所需的一切必要专业知识，能够 (1) 预见故障的危险后果，(2) 监视故障及其后果，以及 (3) 降低可能导致危险的故障几率并采取适当措施。设计人员同意，在使用或分发包含 TI 产品的任何应用前，将彻底测试该等应用和该等应用中所用 TI 产品的功能。

TI 提供技术、应用或其他设计建议、质量特点、可靠性数据或其他服务或信息，包括但不限于与评估模块有关的参考设计和材料（总称“TI 资源”），旨在帮助设计人员开发整合了 TI 产品的应用，如果设计人员（个人，或如果是代表公司，则为设计人员的公司）以任何方式下载、访问或使用任何特定的 TI 资源，即表示其同意仅为该等目标，按照本通知的条款使用任何特定 TI 资源。

TI 所提供的 TI 资源，并未扩大或以其他方式修改 TI 对 TI 产品的公开适用的质保及质保免责声明；也未导致 TI 承担任何额外的义务或责任。TI 有权对其 TI 资源进行纠正、增强、改进和其他修改。除特定 TI 资源的公开文档中明确列出的测试外，TI 未进行任何其他测试。

设计人员只有在开发包含该等 TI 资源所列 TI 产品的应用时，才被授权使用、复制和修改任何相关 TI 资源。但并未依据禁止反言原则或其他法律授予您任何 TI 知识产权的任何其他明示或默示的许可，也未授予您 TI 或第三方的任何技术或知识产权的许可，该等许可包括但不限于任何专利权、版权、屏蔽作品权或与美国 TI 产品或服务的任何整合、机器制作、流程相关的其他知识产权。涉及或参考了第三方产品或服务的信息不构成使用此类产品或服务的许可或与其相关的保证或认可。使用 TI 资源可能需要您向第三方获得对该等第三方专利或其他知识产权的许可。

TI 资源系“按原样”提供。TI 兹免除对资源及其使用作出所有其他明确或默示的保证或陈述，包括但不限于对准确性或完整性、产权保证、无屡发故障保证，以及适销性、适合特定用途和不侵犯任何第三方知识产权的任何默认保证。TI 不负责任何申索，包括但不限于因组合产品所致或与之有关的申索，也不为或对设计人员进行辩护或赔偿，即使该等产品组合已列于 TI 资源或其他地方。对因 TI 资源或其使用引起或与之有关的任何实际的、直接的、特殊的、附带的、间接的、惩罚性的、偶发的、从属或惩戒性损害赔偿，不管 TI 是否获悉可能会产生上述损害赔偿，TI 概不负责。

除 TI 已明确指出特定产品已达到特定行业标准（例如 ISO/TS 16949 和 ISO 26262）的要求外，TI 不对未达到任何该等行业标准要求而承担任何责任。

如果 TI 明确宣称产品有助于功能安全或符合行业功能安全标准，则该等产品旨在帮助客户设计和创作自己的符合相关功能安全标准和要求的的应用。在应用内使用产品的行为本身不会配有安全特性。设计人员必须确保遵守适用于其应用的相关安全要求和标准。设计人员不可将任何 TI 产品用于关乎性命的医疗设备，除非已由各方获得授权的管理人员签署专门的合同对此类应用专门作出规定。关乎性命的医疗设备是指出现故障会导致严重身体伤害或死亡的医疗设备（例如生命保障设备、心脏起搏器、心脏除颤器、人工心脏泵、神经刺激器以及植入设备）。此类设备包括但不限于，美国食品药品监督管理局认定为 III 类设备的设备，以及在美国以外的其他国家或地区认定为同等类别设备的所有医疗设备。

TI 可能明确指定某些产品具备某些特定资格（例如 Q100、军用级或增强型产品）。设计人员同意，其具备一切必要专业知识，可以为自己的应用选择适合的产品，并且正确选择产品的风险由设计人员承担。设计人员单方面负责遵守与该等选择有关的所有法律或监管要求。

设计人员同意向 TI 及其代表全额赔偿因其不遵守本通知条款和条件而引起的任何损害、费用、损失和/或责任。
