

## FEATURES

### High common-mode voltage range

- 4 V to 80 V operating
- −0.3 V to +85 V survival

### Buffered output voltage

Gain = 20 V/V

### Wide operating temperature range: −40°C to +125°C

### Excellent ac and dc performance

- ±100 nV/°C typical offset drift
- ±50 μV typical offset
- ±5 ppm/°C typical gain drift
- 110 dB typical CMRR at dc

## APPLICATIONS

### High-side current sensing

- 48 V telecom
- Power management
- Base stations
- Bidirectional motor control
- Precision high voltage current sources

## GENERAL DESCRIPTION

The AD8218 is a high voltage, high resolution current shunt amplifier. It features a set gain of 20 V/V, with a maximum ±0.35% gain error over the entire temperature range. The buffered output voltage directly interfaces with any typical converter. The AD8218 offers excellent input common-mode rejection from 4 V to 80 V. The AD8218 performs bidirectional current measurements across a shunt resistor in a variety of industrial and telecom applications, including motor control, battery management, and base station power amplifier bias control.

## FUNCTIONAL BLOCK DIAGRAM

Figure 1.

09892-001

The AD8218 offers breakthrough performance throughout the −40°C to +125°C temperature range. It features a zero-drift core, which leads to a typical offset drift of ±100 nV/°C throughout the operating temperature range and the common-mode voltage range. Special attention is devoted to output linearity being maintained throughout the input differential voltage range of 0 mV to ~250 mV. The AD8218 also includes an internal 80 mV reference that can be enabled for optimal dynamic range in unidirectional current sense applications. The typical input offset voltage is ±50 μV.

The AD8218 is offered in an 8-lead MSOP package and an 8-lead LFCSP package.

Slew Rate		1		V/ $\mu\text{s}$	
<b>NOISE</b>					
0.1 Hz to 10 Hz (RTI <sup>1</sup> )		2.3		$\mu\text{V p-p}$	
Spectral Density, 1 kHz (RTI <sup>1</sup> )		110		nV/ $\sqrt{\text{Hz}}$	
<b>POWER SUPPLY</b>					
Operating Range (Pin 2 Floating)	4		80	V	Power regulated from common mode, $V_S$ pin floating
$V_S$ Range (Pin 2)	4		5.5	V	$V_S$ must be less than 5.5 V if standalone supply is used
Quiescent Current over Temperature			800	$\mu\text{A}$	Throughout input common mode
Power Supply Rejection Ratio (PSRR)	90	110		dB	$T_{OPR}$
<b>TEMPERATURE RANGE</b>					
For Specified Performance	-40		+125	$^{\circ}\text{C}$	

<sup>1</sup> RTI = referred to input.

<sup>2</sup> Refer to Figure 9 for more information on the input bias current. This current varies based on the input common-mode voltage. The input bias current flowing to the +IN pin is also the supply current to the internal LDO.

<sup>3</sup> The differential input voltage is specified as 250 mV because the output is internally clamped to 5.2 V. This ensures that the output voltage does not exceed the typical ADC input range, preventing damage. The AD8218 can survive up to  $\pm 5\text{ V}$  differentially but will only amplify  $\sim 250\text{ mV}$  correctly due to the output clamping function.

<sup>4</sup> RTO = referred to output.

## ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
Maximum Input Voltage (+IN, -IN to GND)	-0.3 V to +85 V
Differential Input Voltage (+IN to -IN)	±5 V
Human Body Model (HBM) ESD Rating	±2000 V
Operating Temperature Range (T <sub>OPR</sub> )	-40°C to +125°C
Storage Temperature Range	-65°C to +150°C
Output Short-Circuit Duration	Indefinite

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

Figure 2. MSOP Pin Configuration

## NOTES

1. NC = NO CONNECT. DO NOT CONNECT TO THIS PIN.
2. THE EXPOSED PAD NEEDS TO BE CONNECTED TO PIN 4 (GND).

Figure 3. LFCSP Pin Configuration

Table 3. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	+IN	Noninverting Input.
2	V <sub>S</sub>	Supply Pin. Bypass with a standard 0.1 $\mu$ F capacitor.
3	ENB	Enable. Connect to GND to enable the internal 80 mV reference.
4	GND	Ground.
5	OUT	Output.
6	NC	No Connect. Do not connect to this pin.
7	REF	Reference Input. Connect to a low impedance voltage.
8	-IN	Inverting Input.
	EPAD	Exposed Pad. The exposed pad needs to be connected to Pin 4 (GND). Applies to LFCSP only.

## THEORY OF OPERATION

### AMPLIFIER CORE

In typical applications, the AD8218 amplifies a small differential input voltage generated by the load current flowing through a shunt resistor. The AD8218 rejects high common-mode voltages (up to 80 V) and provides a ground-referenced, buffered output. Figure 28 shows a simplified schematic of the AD8218.

Figure 28. Simplified Schematic

068592-027

The AD8218 is configured as a difference amplifier. The transfer function is

$$OUT = ((R4/R1) \times (V_1 - V_2)) + V_{REF}$$

Resistors R4 and R1 are matched to within 0.01% and have values of 1.5 M $\Omega$  and 75 k $\Omega$ , respectively, meaning an input-to-output total gain of 20 V/V for the AD8218. The difference between V<sub>1</sub> and V<sub>2</sub> is the voltage across the shunt resistor, or V<sub>IN</sub>. Therefore, the input-to-output transfer function of the AD8218 is

$$OUT (V) = (20 \times V_{IN}) + V_{REF}$$

The AD8218 accurately amplifies the input differential signal, rejecting high voltage common modes ranging from 4 V to 80 V.

The main amplifier uses a novel zero-drift architecture, providing the end user with breakthrough temperature stability. The offset drift is typically less than  $\pm 100$  nV/ $^{\circ}$ C. This performance leads to optimal accuracy and dynamic range.

### OUTPUT CLAMPING

After the input common-mode voltage in the application is above 5.2 V, the internal LDO output of the AD8218 also reaches its maximum value of 5.2 V, which is the maximum output range of the AD8218. Because in typical applications the output interfaces with a converter, clamping the AD8218 output voltage to 5.2 V ensures that the ADC input is not damaged due to excessive overvoltage.

## APPLICATION NOTES

### SUPPLY (V<sub>S</sub>) CONNECTIONS

The AD8218 includes an internal LDO, which allows the user to leave the V<sub>S</sub> pin floating, powering the AD8218 directly from the voltage present at Pin 1 (+IN), provided this voltage is in the 4 V to 80 V range. A typical connection for the part in this configuration is shown in Figure 29.

Figure 29. Operation with No V<sub>S</sub> Connection

The AD8218 can also be powered from a separate low impedance supply at Pin 2 (V<sub>S</sub>); however, this voltage can only be in the 4 V to 5.5 V range. In cases where the high voltage bus is susceptible to noise, transients, or high voltage fluctuations and a 5 V supply is available, the AD8218 can be used in the mode depicted in Figure 30.

Figure 30. 5 V Supply Operation

### ENABLE PIN (ENB) OPERATION

The AD8218 includes an internal reference that can be enabled by connecting Pin 3 (ENB) to ground. This mode of operation is shown in Figure 31.

Figure 31. Enabling the Internal 80 mV Reference

In this configuration, the internal 80 mV reference is activated, and the output of the AD8218 is 80 mV when the differential input voltage is 0 V and the voltage at Pin 7 (REF) is also 0 V. This internal reference is useful in unidirectional current measurements where the current being monitored has a very wide range. Setting the output starting point to 80 mV means that when the load current through the shunt resistor is 0 A, the output is 80 mV. This ensures that the output errors due to initial offset and the output saturation range of the amplifier are overcome. In this mode, the transfer function of the AD8218 becomes

$$OUT(V) = OUT(V) = (20 \times V_{IN}) + 0.08 V$$

If Pin 3 is connected to ground, and therefore the internal reference is enabled, 80 mV must always be added to the transfer function of the AD8218.

## APPLICATIONS INFORMATION

### UNIDIRECTIONAL HIGH-SIDE CURRENT SENSING

In the unidirectional high-side current sensing configuration, the shunt resistor is referenced to the battery (see Figure 32). High voltage is present at the inputs of the current sense amplifier. When the shunt is battery referenced, the AD8218 produces a linear ground-referenced analog output. The supply pin,  $V_s$ , of the AD8218 can either be connected to a 5 V supply or left floating (see the Supply ( $V_s$ ) Connections section).

Figure 32. Unidirectional Operation with ENB Connected to GND

The output transfer function curve for unidirectional operation with ENB connected to GND is shown in Figure 33.

Figure 33. Output Transfer Function with ENB Connected to GND

### BIDIRECTIONAL HIGH-SIDE CURRENT SENSING

Inputting a voltage at Pin 7 (REF) offsets the output of the AD8218 and allows for bidirectional current sensing. The transfer function from the REF pin to the output is 1 V/V. For example, a 2.5 V REF input offsets the output of the AD8218 to 2.5 V. See Figure 34 for typical connections. The user must ensure that the voltage applied at Pin 7 (REF) is from a low impedance source.

Figure 34. Bidirectional Operation Using a 2.5 V Reference Input

The output transfer function curve for bidirectional operation using a 2.5 V reference input is shown in Figure 35.

Figure 35. Transfer Function When Using a 2.5 V Reference Input

### MOTOR CONTROL CURRENT SENSING

The AD8218 is a practical, accurate solution for high-side current sensing in motor control applications. In cases where the shunt resistor is referenced to a battery and the current flowing is bidirectional (as shown in Figure 36), the AD8218 monitors the current with no additional supply pin necessary.

Figure 36. High-Side Current Sensing in Motor Control
