

# 3-Phase Half-Bridge Gate-Drive IC

## FAN73896

### Description

The FAN73896 is a monolithic three-phase half-bridge gate-drive IC designed for high-voltage, high-speed, driving MOSFETs and IGBTs operating up to +600 V.

ON Semiconductor's high-voltage process and common-mode noise-canceling technique provide stable operation of high-side drivers under high-dv/dt noise circumstances.

An advanced level-shift circuit allows high-side gate driver operation up to  $V_S = -9.8$  V (typical) for  $V_{BS} = 15$  V.

The protection functions include under-voltage lockout and inverter over-current trip with an automatic fault-clear function. Over-current protection that terminates all six outputs can be derived from an external current-sense resistor. An open-drain fault signal is provided to indicate that an over-current or under-voltage shutdown has occurred. The UVLO circuits prevent malfunction when  $V_{DD}$  and  $V_{BS}$  are lower than the threshold voltage.

Output drivers typically source and sink 350 mA and 650 mA, respectively; which is suitable for three-phase half-bridge applications in motor drive systems.

### Features

- Floating Channel for Bootstrap Operation to +600 V
- Typically 350 mA/650 mA Sourcing/Sinking Current-Driving Capability for All Channels
- Extended Allowable Negative  $V_S$  Swing to -9.8 V for Signal Propagation at  $V_{DD} = V_{BS} = 15$  V
- Output In-Phase with Input Signal
- Over-Current Shutdown Turns Off All Six Drivers
- Matched Propagation Delay for All Channels
- 3.3 V and 5.0 V Input Logic Compatible
- Adjustable Fault-Clear Timing
- Built-in Advanced Input Filter
- Built-in Shoot-Through Prevention Logic
- Built-in Soft Turn-Off Function
- Common-Mode dv/dt Noise-Canceling Circuit
- Built-in UVLO Functions for All Channels
- This is a Pb-Free Device

Table 1. COMPARISON TABLE

Part	FAN73893MX	FAN73894MX	FAN73895MX	FAN73896MX
INPUT Type	Inverted	Inverted	Non-inverted	Non-inverted
$V_{DDUV+} / V_{BSUV+}$ (Min / Typ / Max)	7.5 / 8.5 / 9.3 [V]	10.2 / 11.2 / 12 [V]	7.5 / 8.5 / 9.3 [V]	10.2 / 11.2 / 12 [V]
$V_{DDUV-} / V_{BSUV-}$ (Min / Typ / Max)	7 / 8 / 8.7 [V]	9.7 / 10.7 / 11.4 [V]	7 / 8 / 8.7 [V]	9.7 / 10.7 / 11.4 [V]
Note	(Replacement for FAN73892MX)	-	(Replacement for FAN73891MX)	-

### MARKING DIAGRAM

Pin 1

- FAN73896 = Specific Device Code
- \$Y = ON Semiconductor Logo
- &Z = Assembly Plant Code
- &2 = 2-Digit Date Code Format
- &K = 2-Digits Lot Run Traceability Code

### Applications

- 3-Phase Motor Inverter Driver
- Air Conditioner, Washing Machine, Refrigerator, Dish Washer
- Industrial Inverter – Sewing Machine, Power Tool
- General-Purpose Three-Phase Inverter

### ORDERING INFORMATION

See detailed ordering and shipping information on page 15 of this data sheet.

## PIN DEFINITIONS

Pin	Symbol	Description
1	V <sub>DD</sub>	Logic and low-side gate driver power supply voltage
2	HIN1	Logic Input 1 for high-side gate 1 driver
3	HIN2	Logic Input 2 for high-side gate 2 driver
4	HIN3	Logic Input 3 for high-side gate 3 driver
5	LIN1	Logic Input 1 for low-side gate 1 driver
6	LIN2	Logic Input 2 for low-side gate 2 driver
7	LIN3	Logic Input 3 for low-side gate 3 driver
8	$\overline{FO}$	Fault output with open drain (indicates over-current and low-side under-voltage)
9	CS	Analog input for over-current shutdown
10	EN	Logic input for shutdown functionality
11	RCIN	An external RC network input used to define the fault-clear delay
12	V <sub>SS</sub>	Logic ground
13	COM	Low-side driver return
14	LO3	Low-side gate driver 3 output
15	LO2	Low-side gate driver 2 output
16	LO1	Low-side gate driver 1 output
17, 21, 25	NC	No connect
18	V <sub>S3</sub>	High-side driver 3 floating supply offset voltage
19	HO3	High-side driver 3 gate driver output
20	V <sub>B3</sub>	High-side driver 3 floating supply
22	V <sub>S2</sub>	High-side driver 2 floating supply offset voltage
23	HO2	High-side driver 2 gate driver output
24	V <sub>B2</sub>	High-side driver 2 floating supply
26	V <sub>S1</sub>	High-side driver 1 floating supply offset voltage
27	HO1	High-side driver 1 gate driver output
28	V <sub>B1</sub>	High-side driver 1 floating supply

# FAN73896

## ABSOLUTE MAXIMUM RATINGS (T<sub>A</sub> = 25°C unless otherwise specified)

Symbol	Parameter	Min	Max	Unit
V <sub>S</sub>	High-Side Floating Offset Voltage	V <sub>B1,2,3</sub> - 25	V <sub>B1,2,3</sub> + 0.3	V
V <sub>B</sub>	High-Side Floating Supply Voltage	-0.3	625.0	V
V <sub>DD</sub>	Low-Side and Logic-Fixed supply voltage	-0.3	25.0	V
V <sub>HO</sub>	High-Side Floating Output Voltage V <sub>HO1,2,3</sub>	V <sub>S1,2,3</sub> - 0.3	V <sub>B1,2,3</sub> + 0.3	V
V <sub>LO</sub>	Low-Side Floating Output Voltage V <sub>LO1,2,3</sub>	-0.3	V <sub>DD</sub> + 0.3	V
V <sub>IN</sub>	Input Voltage (HINx, LINx, CS, and EN) (Note 1)	-0.3	5.5	V
V <sub>FO</sub>	Fault Output Voltage (F <sub>O</sub> )	-0.3	V <sub>DD</sub> + 0.3	V
dV <sub>S</sub> /dt	Allowable Offset Voltage Slew Rate	-	±50	V/ns
P <sub>D</sub>	Power Dissipation (Note 2, 3)	-	1.4	W
θ <sub>JA</sub>	Thermal Resistance	-	70	°C/W
T <sub>J</sub>	Junction Temperature	-	150	°C
T <sub>STG</sub>	Storage Temperature	-55	150	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- All input voltage (HINx, LINx, CS, and EN) are referenced to V<sub>SS</sub> and do not exceed maximum voltage rating.
- Mounted on 76.2 x 114.3 x 1.6 mm PCB (FR-4 glass epoxy material). Refer to the following standards:  
*JESD51-2: Integral circuit's thermal test method environmental conditions, natural convection;*  
*JESD51-3: Low effective thermal conductivity test board for leaded surface-mount packages.*
- Do not exceed maximum power dissipation (P<sub>D</sub>) under any circumstances.

## RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Min	Max	Unit
V <sub>B1,2,3</sub>	High-Side Floating Supply Voltage	V <sub>S1,2,3</sub> + 10	V <sub>S1,2,3</sub> + 20	V
V <sub>S1,2,3</sub>	High-Side Floating Supply Offset Voltage	6 - V <sub>DD</sub>	600	V
V <sub>DD</sub>	Low-Side and Logic Fixed Supply Voltage	12	20	V
V <sub>HO1,2,3</sub>	High-Side Output Voltage	V <sub>S1,2,3</sub>	V <sub>B1,2,3</sub>	V
V <sub>LO1,2,3</sub>	Low-Side Output Voltage	COM	V <sub>DD</sub>	V
V <sub>FO</sub>	Fault Output Voltage (F <sub>O</sub> )	V <sub>SS</sub>	V <sub>DD</sub>	V
V <sub>CS</sub>	Current-Sense Pin Input Voltage	V <sub>SS</sub>	5	V
V <sub>IN</sub>	Logic Input Voltage (HIN1,2,3 and LIN1,2,3)	V <sub>SS</sub>	5	V
COM	Low-Side Driver Return	-5	5	V
T <sub>A</sub>	Ambient Temperature	-40	+125	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

$R_{DSFO}$	Fault Output On Resistance	$I_{FO} = 1.5 \text{ mA}$	90	130	170	$\Omega$

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

4. These parameters are guaranteed by design.

**DYNAMIC ELECTRICAL CHARACTERISTICS** ( $T_A = 25^\circ\text{C}$ ,  $V_{BIAS}$  ( $V_{DD}$ ,  $V_{BS1,2,3}$ ) = 15.0 V,  $V_{S1,2,3} = \text{COM}$ ,  $C_{RCIN} = 2 \text{ nF}$ , and  $C_{Load} = 1000 \text{ pF}$  unless otherwise specified.)

Symbol	Parameter	Condition	Min	Typ	Max	Unit
$t_{ON}$	Turn-On Propagation Delay	$V_{LIN1,2,3} = V_{HIN1,2,3} = 5 \text{ V}$ , $V_{S1,2,3} = 0 \text{ V}$	350	500	650	ns
$t_{OFF}$	Turn-Off Propagation Delay	$V_{LIN1,2,3} = V_{HIN1,2,3} = 0 \text{ V}$ , $V_{S1,2,3} = 0 \text{ V}$	350	500	650	ns
$t_R$	Turn-On Rise Time	$V_{LIN1,2,3} = V_{HIN1,2,3} = 5 \text{ V}$	20	50	100	ns
$t_F$	Turn-Off Fall Time	$V_{LIN1,2,3} = V_{HIN1,2,3} = 0 \text{ V}$	10	30	80	ns
$t_{EN}$	Enable LOW to Output Shutdown Delay		400	500	600	ns
$t_{CSBLT}$	CS Pin Leading-Edge Blanking Time		400	650	850	ns
$t_{CSFO}$	Time from CS Triggering to $\overline{FO}$	From $V_{CSC} = 1 \text{ V}$ to $\overline{FO}$ Turn-Off	-	850	1300	ns
$t_{CSOFF}$	Time from CS Triggering to Low-Side Gate Outputs Turn-Off	From $V_{CSC} = 1 \text{ V}$ to Starting Gate Turn-Off	-	850	1300	ns
$t_{FLTIN}$	Input Filtering Time (Note 5) ( $HINx$ , $LINx$ , $EN$ )		170	250	330	ns
$t_{FLTCLR}$	Fault-Clear Time		-	1.30	2.35	ms
DT	Dead Time		230	320	400	ns
MDT	Dead-Time Matching (All Six Channels) (Note 6)		-	-	50	ns
MT	Delay Matching (All Six Channels) (Note 7)		-	-	50	ns
PM	Output Pulse-Width Matching (Note 8)	$PW_{IN} > 1 \mu\text{s}$	-	50	100	ns

5. The minimum width of the input pulse should exceed 500 ns to ensure the filtering time of the input filter is exceeded.

6. MDT is defined as  $|DT1 - DT2|$  referenced to 0.

7. MT is defined as an absolute value of matching delay time between High-side and Low-side.

8. PM is defined as an absolute value of matching pulse-width between Input and Output.

Figure 35. Input / Output Timing Diagram

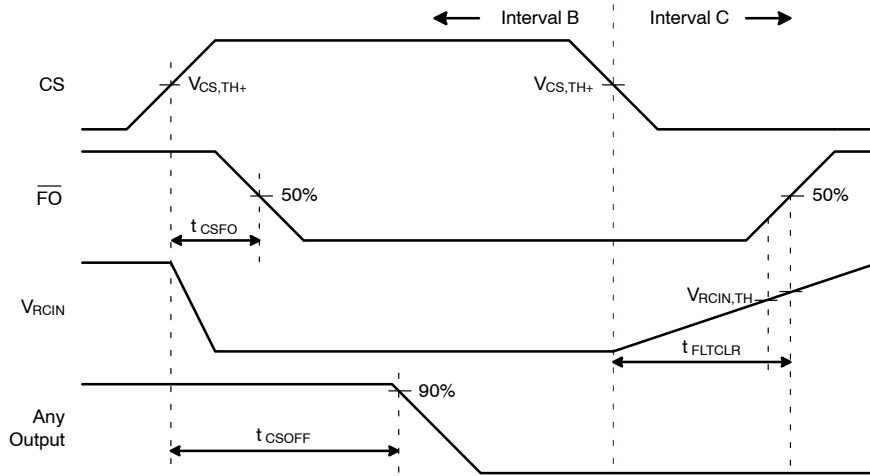

Figure 36. Detailed View of B and C Intervals During Over-Current Protection

APPLICATIONS INFORMATION

**Dead Time**

Dead time is automatically inserted whenever the dead time of the external two input signals (between HINx and LINx signals) is shorter than internal fixed dead times (DT1 and DT2). Otherwise, external dead times larger than internal dead times are not modified by the gate driver and internal dead-time waveform definition is shown in Figure 37.

**Figure 37. Internal Dead-Time Definitions**

**Protection Function**

*Fault Out (FO) and Under-Voltage Lockout*

The high- and low-side drivers include under-voltage lockout (UVLO) protection circuitry that monitors the supply voltage for V<sub>DD</sub> and V<sub>BS</sub> independently. It can be designed to prevent malfunction when V<sub>DD</sub> and V<sub>BS</sub> are lower than the specified threshold voltage. The UVLO hysteresis prevents chattering during power-supply transitions. Moreover, the fault signal (power supply voltage FO) goes to LOW state to operate reliably during power-on events when the power supply (V<sub>DD</sub>) is below the under-voltage lockout high threshold voltage for the circuit (during t<sub>1</sub>~t<sub>2</sub>). The UVLO circuit is not otherwise activated; shown Figure 38.

**Figure 38. Waveforms for Under-Voltage Lockout**

*Shoot-Through Protection*

The shoot-through protection circuitry prevents both high- and low-side switches from conducting at the same time, as shown Figure 39.

**Figure 39. Shoot-Through Protection**

An interlock function is a device used to prevent both high- and low-side switches from conducting at the same time as shown in Figure 40. In most applications an interlock is used to help prevent a device from harming its operator or damaging itself by when two input signals of a same leg are activated simultaneously, only one output is activated.

- S1 : High-side first → First input output mode
- S2 : Low-side noise → No LOx output mode
- S3 : High-side noise → No HOx output mode
- S4 : Low-side first → First input output mode
- S5 : In-phase mode → No HOx output

**Figure 40. Interlock Function**

**Enable Input**

When the EN pin is in HIGH state, the gate driver operates normally. When a condition occurs that should shut down the gate driver, the EN pin should be LOW. The enable circuitry has an input filter; the minimum input duration is specified by  $t_{FLTIN}$  (typically 250 ns).

**Figure 41. Output Enable Timing Waveform**

**Fault-Out ( $\overline{FO}$ ) and Over-Current Protection**

FAN73896 provides an integrated fault output ( $\overline{FO}$ ) and an adjustable fault-clear timer ( $t_{FLTCLR}$ ). There are two situations that cause the gate driver to report a fault via the  $\overline{FO}$  pin. The first is an under-voltage condition of low-side gate driver supply voltage ( $V_{DD}$ ) and the second is when the current-sense pin (CS) recognizes a fault. If a fault condition occurs, the  $\overline{FO}$  pin is internally pulled to COM, the fault-clear timer is activated, and all outputs (HO1, 2, 3 and LO1, 2, 3) of the gate driver are turned off. The fault output stays LOW until the fault condition has been removed and the fault-clear timer expires. Once the fault-clear timer expires, the voltage on the  $\overline{FO}$  pin returns to pull-up voltage.

The fault-clear time ( $t_{FLTCLR}$ ) is determined by an internal current source ( $I_{RCIN} = 5 \mu A$ ) and an external  $C_{RCIN}$  at the RCIN pin, as shown as:

$$t_{FLTCLR} = \frac{C_{RCIN} \times V_{RCIN,TH}}{I_{RCIN}} [s] \quad (eq. 1)$$

The  $R_{DSRCIN}$  of the MOSFET is a characteristic discharge curve with respect to the external capacitor  $C_{RCIN}$ . The time constant is defined by the external capacitor  $C_{RCIN}$  and the  $R_{DSRCIN}$  of the MOSFET.

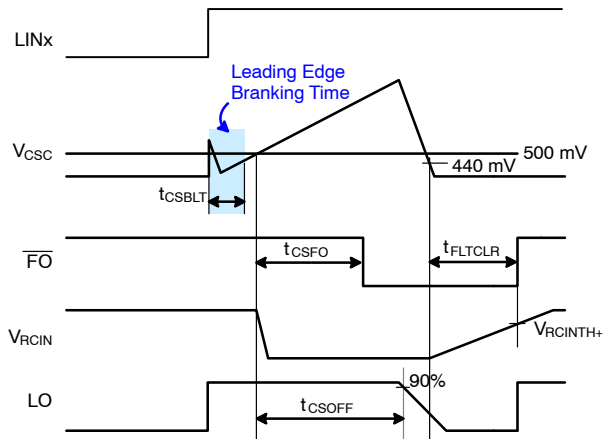

The output of current-sense comparator (CS\_COMP) passes a noise filter, which inhibits an over-current shutdown caused by parasitic voltage spikes of  $V_{CS}$ .

This corresponds to a voltage level at the comparator of  $V_{CSTH+} - V_{CSHYS} = 500 \text{ mV} - 60 \text{ mV} = 440 \text{ mV}$ , where  $V_{CSHYS} = 60 \text{ mV}$  is the hysteresis of the current comparator (CS\_COMP), as shown in Figure 42.

**Figure 42. Over-Current Protection**

Figure 43 shows the waveform definitions of RCIN,  $\overline{FO}$ , and the low-side driver; which uses a soft turn-off method when an under-voltage condition of the low-side gate driver supply voltage ( $V_{DD}$ ) or the current-sense pin (CS) recognizes a fault. If a fault condition occurs, the  $\overline{FO}$  Pin is internally pulled to COM and all outputs (HO1, 2, 3 and LO1, 2, 3) of the gate driver are turned off. Low-side outputs decline linearly by the internal sink current source ( $I_{SOFT} = 40 \text{ mA}$ ) for soft turn-off, as shown in Figure 43.

**Figure 43. RCIN and Fault-Clear Waveform Definition**

**Noise Filter**

**Input Noise Filter**

Figure 44 shows the input noise filter method, which has symmetry duration between the input signal ( $t_{INPUT}$ ) and the output signal ( $t_{OUTPUT}$ ) and helps to reject noise spikes and short pulses. This input filter is applied to the HINx, LINx, and EN inputs. The upper pair of waveforms (Example A) shows input signal duration ( $t_{INPUT}$ ) much longer than input filter time ( $t_{FLTIN}$ ); it is approximately the same duration between the input signal time ( $t_{INPUT}$ ) and the output signal time ( $t_{OUTPUT}$ ). The lower pair of waveforms (Example B) shows an input signal time ( $t_{INPUT}$ ) slightly longer than input filter time ( $t_{FLTIN}$ ); it is approximately the same duration between input signal time ( $t_{INPUT}$ ) and the output signal time ( $t_{OUTPUT}$ ).

**Figure 44. Input Noise Filter Definition**

*Short-Pulsed Input Noise Rejection Method*

The input filter circuitry provides protection against short-pulsed input signals (HINx, LINx and EN) on the input signal lines by applied noise signal.

If the input signal duration is less than input filter time ( $t_{FLTIN}$ ), the output does not change states.

Example A and B of the Figure 45 show the input and output waveforms with short-pulsed noise spikes with a duration less than input filter time; the output does not change states.

**Figure 45. Noise Rejecting Input Filter Definition**

Figure 46 shows the characteristics of the input filters while receiving narrow ON and OFF pulses. If input signal pulse duration,  $PW_{IN}$ , is less than input filter time,  $t_{FLTIN}$ ; the output pulse,  $PW_{OUT}$ , is zero. The input signal is rejected by input filter. Once the input signal pulse duration,  $PW_{IN}$ , exceeds input filter time,  $t_{FLTIN}$ , the output pulse durations,  $PW_{OUT}$ , matches the input pulse durations,  $PW_{IN}$ . FAN73896 input filter time,  $t_{FLTIN}$ , is about 250 ns for the high- and low-side outputs.

**Figure 46. Input Filter Characteristic of Narrow ON**

**ORDERING INFORMATION**

Part Number	Package	Operating Temperature	Shipping†
FAN73896MX (Note 9)	28-Lead, Small Outline Integrated Circuit, (SOIC) (Pb-Free)	-40 to +125°C	1000 / Tape & Reel

†For information on tape and reel specifications, including part orientation and tape sizes, please refer to our Tape and Reel Packaging Specifications Brochure, BRD8011/D.

9. These devices passed wave-soldering test by JESD22A-111.
