

Features

- ESD Protection for 1 Line with Bi-directional
- Provide ESD protection for the protected line to IEC 61000-4-2 (ESD) ±15kV (air / contact)
 IEC 61000-4-4 (EFT) 40A (5/50ns)
 Cable Discharged Event (CDE)
- Suitable for, 33V and below, operating voltage applications
- 0402 small DFN package saves board space
- Protect one I/O line or one power line
- Fast turn-on and low clamping voltage
- Solid-state silicon-avalanche and active circuit triggering technology
- Green part

Applications

- Cellular Handsets and Accessories
- Small Panel Modules
- Control Signal Line Protection
- Power Line Protection
- Portable Devices
- Touch Panels
- Notebooks and Handhelds
- Peripherals

Description

AZ4233-01F is a design which includes one bi-directional ESD rated clamping cell to protect one power line, or one control line, or one low speed data line in an electronic system. The AZ4233-01F has been specifically designed to protect sensitive components which are connected to data and transmission lines from

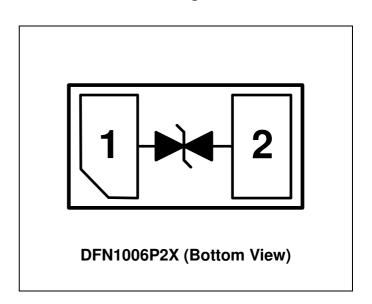

over-voltage damage caused by Electrostatic Discharging (ESD), Electrical Fast Transients (EFT), and Cable Discharge Event (CDE).

AZ4233-01F is a unique design which includes proprietary clamping cell in a single package. During transient conditions, the proprietary clamping cell prevents over-voltage on the power line or control/data lines, protecting any downstream components.

AZ4233-01F is bi-directional and may be used on lines where the signal swings above and below ground.

AZ4233-01F may be used to meet the ESD immunity requirements of IEC 61000-4-2, Level 4 (±15kV air, ±8kV contact discharge).

Typical Characteristics

Applications Information

The AZ4233-01F is designed to protect one line against system ESD/EFT/CDE pulse by clamping it to an acceptable reference. It provides bi-directional protection.

The usage of the AZ4233-01F is shown in Fig. 1. Protected line, such as data line, control line, or power line, is connected at pin 1. The pin 2 is connected to a ground plane on the board. In order to minimize parasitic inductance in the board traces, all path lengths connected to the pins of AZ4233-01F should be kept as short as possible.

In order to obtain enough suppression of ESD induced transient, good circuit board is critical. Thus, the following guidelines are recommended:

- Minimize the path length between the protected lines and the AZ4233-01F.
- Place the AZ4233-01F near the input terminals or connectors to restrict transient coupling.
- The ESD current return path to ground should be kept as short as possible.
- Use ground planes whenever possible.
- NEVER route critical signals near board edges and near the lines which the ESD transient easily injects to.

Fig. 2 shows another simplified example of using AZ4233-01F to protect the control line, low speed

data line, and power line from ESD transient stress.
