1.3 Development tools

1.3.1 Compiler

We do not provide the compiler. Please contact the third parties.

The core of MC96F8208S is Mentor 8051. And, device ROM size is smaller than 64k bytes. Developer can use all kinds of third party's standard 8051 compiler.

1.3.2 OCD(On-chip debugger) emulator and debugger

The OCD (On Chip Debug) emulator supports ABOV Semiconductor's 8051 series MCU emulation.

The OCD interface uses two-wire interfacing between PC and MCU which is attached to user's system. The OCD can read or change the value of MCU internal memory and I/O peripherals. And the OCD also controls MCU internal debugging logic, it means OCD controls emulation, step run, monitoring, etc.

The OCD Debugger program works on all Microsoft-Windows operating system.

If you want to see more details, please refer to OCD debugger manual. You can download debugger S/W and manual from our web-site.

Connection:

- DSCL (MC96F8208 EVA P01 port)
- DSDA (MC96F8208 EVA P00 port)

NOTE)

1. MC96F8208S does not support the OCD function. MC96F8208 EVA should be used for debugging.

1.4 MTP programming

1.4.1 Overview

The program memory of MC96F8208S is MTP Type. This flash is accessed by serial data format. There are four pins(DSCL, DSDA, VDD, VSS) for programming/reading the flash.

Pin name	Main chip pin name	During programming	
		I/O	Description
DSCL	P01	I	Serial clock pin. Input only pin.
DSDA	P00	I/O	Serial data pin. Output port when reading and input port when programming. Can be assigned as input/push-pull output port.
VDD, VSS	VDD, VSS	-	Logic power supply pin.

Table 1.3 Descriptions of pins which are used to programming/reading the Flash

1.4.2 On-Board programming

The MC96F8208S needs only four signal lines including VDD and VSS pins for programming FLASH with serial protocol. Therefore the on-board programming is possible if the programming signal lines are considered when the PCB of application board is designed.

1.4.3 Circuit Design Guide

At the FLASH programming, the programming tool needs 4 signal lines that are DSCL, DSDA, VDD, and VSS. When you design the PCB circuits, you should consider the usage of these signal lines for the on-board programming. Please be careful to design the related circuit of these signal pins because rising/falling timing of DSCL and DSDA is very important for proper programming.

These graphs and tables provided in this section are only for design guidance and are not tested or guaranteed. In graphs or tables some data are out of specified operating range (e.g. out of specified VDD range). This is only for information and devices are guaranteed to operate properly only within the specified range.

The data presented in this section is a statistical summary of data collected on units from different lots over a period of time. "Typical" represents the mean of the distribution while "max" or "min" represents (mean + 3σ) and (mean - 3σ) respectively where σ is standard deviation.
