

# Self Protected Very Low Iq High Side Driver with Analog Current Sense

## NCV84140

The NCV84140 is a fully protected single channel high side driver that can be used to switch a wide variety of loads, such as bulbs, solenoids, and other actuators. The device incorporates advanced protection features such as active inrush current management, over-temperature shutdown with automatic restart and an overvoltage active clamp. A dedicated Current Sense pin provides precision analog current monitoring of the output as well as fault indication of short to  $V_D$ , short circuit to ground and OFF state open load detection. An active high Current Sense Enable pin allows all diagnostic and current sense features to be enabled.

### Features

- Short Circuit Protection with Inrush Current Management
- CMOS (3 V / 5 V) Compatible Control Input
- Very Low Standby Current
- Very Low Current Sense Leakage
- Proportional Load Current Sense
- Current Sense Enable
- Off State Open Load Detection
- Output Short to  $V_D$  Detection
- Overload and Short to Ground Indication
- Thermal Shutdown with Automatic Restart
- Undervoltage Shutdown
- Integrated Clamp for Inductive Switching
- Loss of Ground and Loss of  $V_D$  Protection
- ESD Protection
- Reverse Battery Protection with External Components
- AEC-Q100 Qualified
- This is a Pb-Free Device

### Typical Applications

- Switch a Variety of Resistive, Inductive and Capacitive Loads
- Can Replace Electromechanical Relays and Discrete Circuits
- Automotive / Industrial

### FEATURE SUMMARY

$R_{DSon}$ (typical) $T_J = 25^\circ\text{C}$	$R_{ON}$	140	m $\Omega$
Output Current Limit (typical)	$I_{lim}$	12	A
OFF-state Supply Current (max)	$I_{D(off)}$	0.5	$\mu\text{A}$

**Table 3. MAXIMUM RATINGS**

Rating	Symbol	Value		Unit
DC Supply Voltage	$V_D$	-0.3	38	V
Max Transient Supply Voltage (Note 1) Load Dump – Suppresses	$U_S^*$	-	45	V
Input Voltage	$V_{IN}$	-10	10	V
Input Current	$I_{IN}$	-5	5	mA
Reverse Ground Pin Current	$I_{GND}$	-	-200	mA
Output Current (Note 2)	$I_{OUT}$	-6	Internally Limited	A
Reverse CS Current	$I_{CS}$	-	-200	mA
CS Voltage	$V_{CS}$	$V_D - 41$	$V_D$	V
CS_EN Voltage	$V_{CS\_EN}$	-10	10	V
CS_EN Current	$I_{CS\_EN}$	-5	5	mA
Power Dissipation $T_c = 25^\circ\text{C}$ (Note 5)	$P_{tot}$	1.17		W
Electrostatic Discharge (Note 3) (HBM Model 100 pF / 1500 $\Omega$ )	$V_{ESD}$			DC
Input		4	-	kV
Current Sense		4	-	kV
Current Sense Enable		4	-	kV
Output		4	-	kV
$V_D$		4	-	kV
Charged Device Model CDM-AEC-Q100-011		750	-	V
Single Pulse Inductive Load Switching Energy ( $L = 5\text{ mH}$ , $I_L = 3.84\text{ A}$ , $T_{Jstart} = 150^\circ\text{C}$ , $V_D$ tied to GND during inductive discharge)	$E_{AS}$	-	36.8	mJ
Operating Junction Temperature	$T_J$	-40	+150	$^\circ\text{C}$
Storage Temperature	$T_{storage}$	-55	+150	$^\circ\text{C}$

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Load Dump Test B (with centralized load dump suppression) according to ISO16750-2 standard. Guaranteed by design. Not tested in production. Passed Class C (or A, B) according to ISO16750-1.
2. Reverse Output current has to be limited by the load to stay within absolute maximum ratings and thermal performance.
3. This device series incorporates ESD protection and is tested by the following methods:  
 ESD Human Body Model tested per AEC-Q100-002 (JS-001-2017)  
 Field Induced Charge Device Model ESD characterization is not performed on plastic molded packages with body sizes smaller than 2 x 2 mm due to the inability of a small package body to acquire and retain enough charge to meet the minimum CDM discharge current waveform characteristic defined in JEDEC JS-002-2018

**Table 4. THERMAL RESISTANCE RATINGS**

Parameter	Symbol	Max. Value	Units
Thermal Resistance			$^\circ\text{C}/\text{W}$

<b>Class</b>					
Class	Functional Status				
A	All functions of a device perform as designed during and after exposure to disturbance.				
B	All functions of a device perform as designed during exposure. However, one or more of them can go beyond specified tolerance. All functions return automatically to within normal limits after exposure is removed. Memory functions shall remain class A.				
C	One or more functions of a device do not perform as designed during exposure but return automatically to normal operation after exposure is removed.				
D	One or more functions of a device do not perform as designed during exposure and do not return to normal operation until exposure is removed and the device is reset by simple "operator/use" action.				
E	One or more functions of a device do not perform as designed during and after exposure and cannot be returned to proper operation without replacing the device.				

APPLICATION INFORMATION

Figure 33. Application Schematic

**Loss of Ground Protection**

When device or ECU ground connection is lost and load is still connected to ground, the device will turn the output OFF. In loss of ground state, the output stage is held OFF independent of the state of the input. Input resistors are recommended between the device and microcontroller.

**Reverse Battery Protection**

*Solution 1: Resistor in the GND line only (no parallel Diode)*

The following calculations are true for any type of load.

In the case for no diode in parallel with  $R_{GND}$ , the calculations below explain how to size the resistor.

Consider the following parameters:

$-I_{GND}$  Maximum = 200 mA for up to  $-V_D = 32$  V.

Where  $-I_{GND}$  is the DC reverse current through the GND pin and  $-V_D$  is the DC reverse battery voltage.

$$-I_{GND} = \frac{-V_D}{R_{GND}} \quad (\text{eq. 1})$$

Since this resistor can be used amongst multiple High-Side devices, please take note the sum of the maximum active GND currents ( $I_{GND(On)max}$ ) for each device when sizing the resistor. Please note that if the microprocessor GND is not shared by the device GND, then  $R_{GND}$  produces a shift of ( $I_{GND(On)max} \times R_{GND}$ ) in the input thresholds and CS output values. If the calculated power dissipation leads to too large of a resistor size or several devices have to share the same resistor, please look at the second solution for Reverse Battery Protection. Refer to Figure 35 for selecting the proper  $R_{GND}$ .

**Figure 34. Reverse Battery  $R_{GND}$  Considerations**

*Solution 2: Diode ( $D_{GND}$ ) in parallel with  $R_{GND}$  in the ground line.*

A resistor value of  $R_{GND} = 1$  kOhm should be selected and placed in parallel to  $D_{GND}$  if the device drives an inductive load. The diode ( $D_{GND}$ ) provides a ~600–700 mV shift in

the input threshold and current sense values if the micro controller ground is not common to the device ground. This shift will not vary even in the case of multiple high-side devices using the same resistor/diode network.

**Undervoltage Protection**

The device has two under-voltage threshold levels,  $V_{D\_MIN}$  and  $V_{UV}$ . Switching function (ON/OFF) requires supply voltage to be at least  $V_{D\_MIN}$ . The device features a lower supply threshold  $V_{UV}$ , above which the output can

remain in ON state. While all protection functions are guaranteed when the switch is ON, diagnostic functions are operational only within nominal supply voltage range  $V_D$ .

**Figure 35. Undervoltage Behavior**

**Overvoltage Protection**

The NCV84140 has two Zener diodes  $Z_{VD}$  and  $Z_{CS}$ , which provide integrated overvoltage protection.  $Z_{VD}$  protects the logic block by clamping the voltage between supply pin  $V_D$  and ground pin GND to  $V_{ZVD}$ .  $Z_{CS}$  limits voltage at current sense pin CS to  $V_D - V_{ZCS}$ . The output power MOSFET's output clamping diodes provide protection by clamping the voltage across the MOSFET (between  $V_D$  pin and OUT pin) to  $V_{CLAMP}$ . During overvoltage protection, current flowing through  $Z_{VD}$ ,  $Z_{CS}$  and the output clamp must be limited. Load impedance  $Z_L$  limits the current in the body diode  $Z_{Body}$ . In order to limit the current in  $Z_{VD}$  a resistor,  $R_{GND}$  (150  $\Omega$ ), is required in the GND path. External resistors  $R_{CS}$  and  $R_{SENSE}$  limit the current flowing through  $Z_{CS}$  and out of the CS pin into the micro-controller I/O pin. With  $R_{GND}$ , the GND pin voltage is elevated to  $V_D - V_{ZVD}$  when the supply voltage  $V_D$  rises above  $V_{ZVD}$ . ESD diodes  $Z_{ESD}$  pull up the voltage at logic pins IN, CS\_EN close to the GND pin voltage  $V_D - V_{ZVD}$ . External resistors  $R_{IN}$ , and  $R_{CS\_EN}$  are required to limit the current flowing out of the logic pins into the micro-controller I/O pins. During overvoltage exposure, the device transitions into a self-protection state, with

automatic recovery after the supply voltage comes back to the normal operating range. The specified parameters as well as short circuit robustness and energy capability cannot be guaranteed during overvoltage exposure.

**Overload Protection**

Current limitation as well as overtemperature shutdown mechanisms are integrated into NCV84140 to provide protection from overload conditions such as bulb inrush or short to ground.

**Current Limitation**

In case of overload, NCV84140 limits the current in the output power MOSFET to a safe value. Due to high power dissipation during current limitation, the device's junction temperature increases rapidly. In order to protect the device, the output driver is shut down by one of the two overtemperature protection mechanisms. The output current limit is dependent on the device temperature, and will fold back once the die reaches thermal shutdown. If the input remains active during the shutdown, the output power MOSFET will automatically be re-activated after a minimum OFF time or when the junction temperature returns to a safe level.

**Output Clamping with Inductive Load Switch Off**

The output voltage  $V_{OUT}$  drops below GND potential when switching off inductive loads. This is because the inductance develops a negative voltage across the load in response to a decaying current. The integrated clamp of the device clamps the negative output voltage to a certain level

relative to the supply voltage  $V_{BAT}$ . During output clamping with inductive load switch off, the energy stored in the inductance is rapidly dissipated in the device resulting in high power dissipation. This is a stressful condition for the device and the maximum energy allowed for a given load inductance should not be exceeded in any application.

Figure 36. Inductive Load Switching

Figure 37. Maximum Switch-Off Current vs. Load Inductance,  $V_D = 13.5\text{ V}$ ,  $R_L = 0\ \Omega$

**Open Load Detection in OFF State**

Open load diagnosis in OFF state can be performed by activating an external resistive pull-up path ( $R_{PU}$ ) to  $V_{BAT}$ . To calculate the pull-up resistance, external leakage

currents (designed pull-down resistance, humidity-induced leakage etc) as well as the open load threshold voltage  $V_{OL}$  have to be taken into account.

**Figure 38. Open Load Detection in Off State**

**Current Sense in PWM Mode**

When operating in PWM mode, the current sense functionality can be used, but the timing of the input signal and the response time of the current sense need to be considered. When operating in PWM mode, the following performance is to be expected. The CS\_EN pin should be held high to eliminate any unnecessary delay time to the circuit. When  $V_{IN}$  switches from low to high, there will be a typical delay ( $t_{CS\_High2}$ ) before the current sense responds. Once this timing delay has passed, the rise time of the current

sense output ( $\Delta t_{CS\_High2}$ ) also needs to be considered. When  $V_{IN}$  switches from high to low a delay time ( $t_{CS\_Low1}$ ) needs to be considered. As long as these timing delays are allowed, the current sense pin can be operated in PWM mode.

**EMC Performance**

If better EMC performance is needed, connect a  $C_1 = 100$  nF,  $C_2 = C_3 = 10$  nF ceramic capacitors to the pins as close to the device as possible according to Figure 39.

**Figure 39. EMC Capacitors Placement**

A listing of ON Semiconductor's product/patent coverage may be accessed at [www.onsemi.com/site/pdf/Patent-Marking.pdf](http://www.onsemi.com/site/pdf/Patent-Marking.pdf). ON Semiconductor reserves the right to make changes without further notice to any products herein. ON Semiconductor makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does ON Semiconductor assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using ON Semiconductor products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by ON Semiconductor. "Typical" parameters which may be provided in ON Semiconductor data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. ON Semiconductor does not convey any license under its patent rights nor the rights of others. ON Semiconductor products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use ON Semiconductor products for any such unintended or unauthorized application, Buyer shall indemnify and hold ON Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that ON Semiconductor was negligent regarding the design or manufacture of the part. ON Semiconductor is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
