## IR Receiver Modules for Remote Control Systems

### ◆ Description

The Series is a Bi-CMOS IC for use in infrared remote control system.

They are transfer-molded, small size, light weight and low current consumption modules.

The strong points of modules are reliable operation even under disturbing ambient light source, and the protection against uncontrolled output pulses.

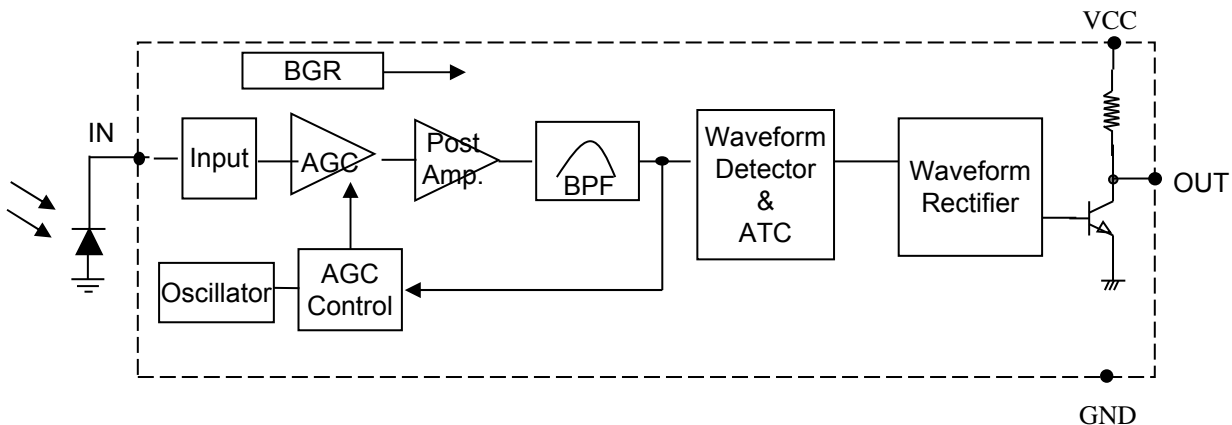

### ◆ Features

- Supply Voltage Range: 2.7V ~ 5.5 V
- TTL and CMOS compatibility
- No external components Except PIN Diode
- Available for Carrier Frequencies between 32.7kHz to 56.7kHz,  
( Adjusted by zener-Diode Fusing, 32.7kHz,36.0kHz. 36.7kHz,37.9kHz,40kHz. 56.7kHz)
- Internal filter for PCM frequency
- Open collector output (built-in Pull-up resistor 40 k $\Omega$  )
- Output active low
- No occurrence of disturbance pulses at output pin within nominal conditions.
- Short settling time after power On ( below 1msec)
- Enhanced Immunity against all kinds of disturbance light and power noise
- safety against power supply ripple noise for almost set applications.  
(especially, High performance characteristics than the other ICs without electrolytic condenser for power noise suppression.)

### ◆ Applications

- TV, VCR, AUDIO
- Home Appliances
- Remote Control Equipment

- $t_{Preburst}$  ; lead code of data word

◆ External Application Circuit - Power Noise reduction & ESD Protection

[Fig.10] Application for power supply ripple suppression

A further influence to the IR receiver modules may come from a supply voltage which is not stable. Such a disturbed supply voltage can be caused by switching power supply which is not filtered well or by other components in the circuit which produced spikes on the supply line. This disturbed supply will reduce the sensitivity of receiver modules. This application circuit will filter the disturbed supply voltage.
