

### Buck DC/DC Converter for Energy Harvester with Adjustable Maximum Power Point Control, Adjustable Output Voltage and PG Function

No. EA-422-201210

#### OVERVIEW

R1801K is a power-storing buck DC/DC converter for a photovoltaic and vibration energy harvester. The Power Good (PG) function can output PG signal according to the output voltage facilitating to build a system. A low operating quiescent current allows a harvester to be used under a low-illumination environment, and it is suitable for an equipment with low power supplied from a harvester.

#### KEY BENEFITS

- Providing a low power supply ( $I_Q$  200 nA) and a high efficiency (approximately 80% @ 10  $\mu$ A).
- Monitoring the output voltage to output Power Good (PG) signal.
- Adjustable the output voltage and maximum power point control voltage in 100 mV step by the setting pins.

#### KEY SPECIFICATIONS

- Input Voltage Range: 2.3 V to 5.5 V
- Output Voltage Range: 2.3 V to 4.5 V
- Maximum Power Point Control Voltage Range: 2.7 V to 5.3 V
- Output Voltage Accuracy:  $\pm 3.0\%$
- Operating Quiescent Current:  
Typ. 200 nA ( $T_a = 25^\circ\text{C}$ , at no load)  
under condition of  $V_{IN} = 4\text{ V}$ ,  $V_{OUT} = 3.0\text{ V}$
- Starting Power: 1  $\mu$ W ( $V_{IN} = 4\text{ V}$ ,  $V_{OUT} = 3.0\text{ V}$ )
- Reverse Current Protection ( $V_{IN} \geq 2.0\text{ V}$ )
- Adjustable Maximum Power Point Control, Adjustable Output Voltage
- Power Good Function

#### TYPICAL CHARACTERISTICS

Efficiency vs. Output Current  $V_{OUT} = 3.0\text{ V}$

#### APPLICATION

- Energy harvesting module of a photovoltaic and vibration energy harvester

#### PACKAGE

DFN(PLP)2730-12

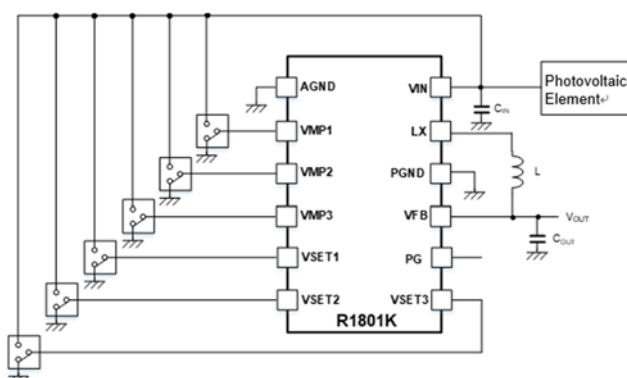

3.0 mm x 2.7 mm x 0.6 mm

#### SELECTION GUIDE

Product Name	Package	Quantity per Reel
R1801KxxxA-TR	DFN(PLP)2730-12	5,000 pcs

xxx: Select the ideal combination of the set output voltage ( $V_{SET}$ ) and the set maximum power point control voltage ( $V_{MPSET}$ ) from the code number starting from 001.

#### TYPICAL APPLICATION

$L = 22\text{ }\mu\text{H}$ ,  $C_{IN} = 10\text{ }\mu\text{F}$ ,  $C_{OUT} = 47\text{ }\mu\text{F}$

## SELECTION GUIDE

The set output voltage and the set maximum power point control voltage are user-selectable options.

### Selection Guide

Product Name	Package	Quantity per Reel	Pb Free	Halogen Free
R1801KxxxA-TR	DFN(PLP)2730-12	5,000 pcs	Yes	Yes

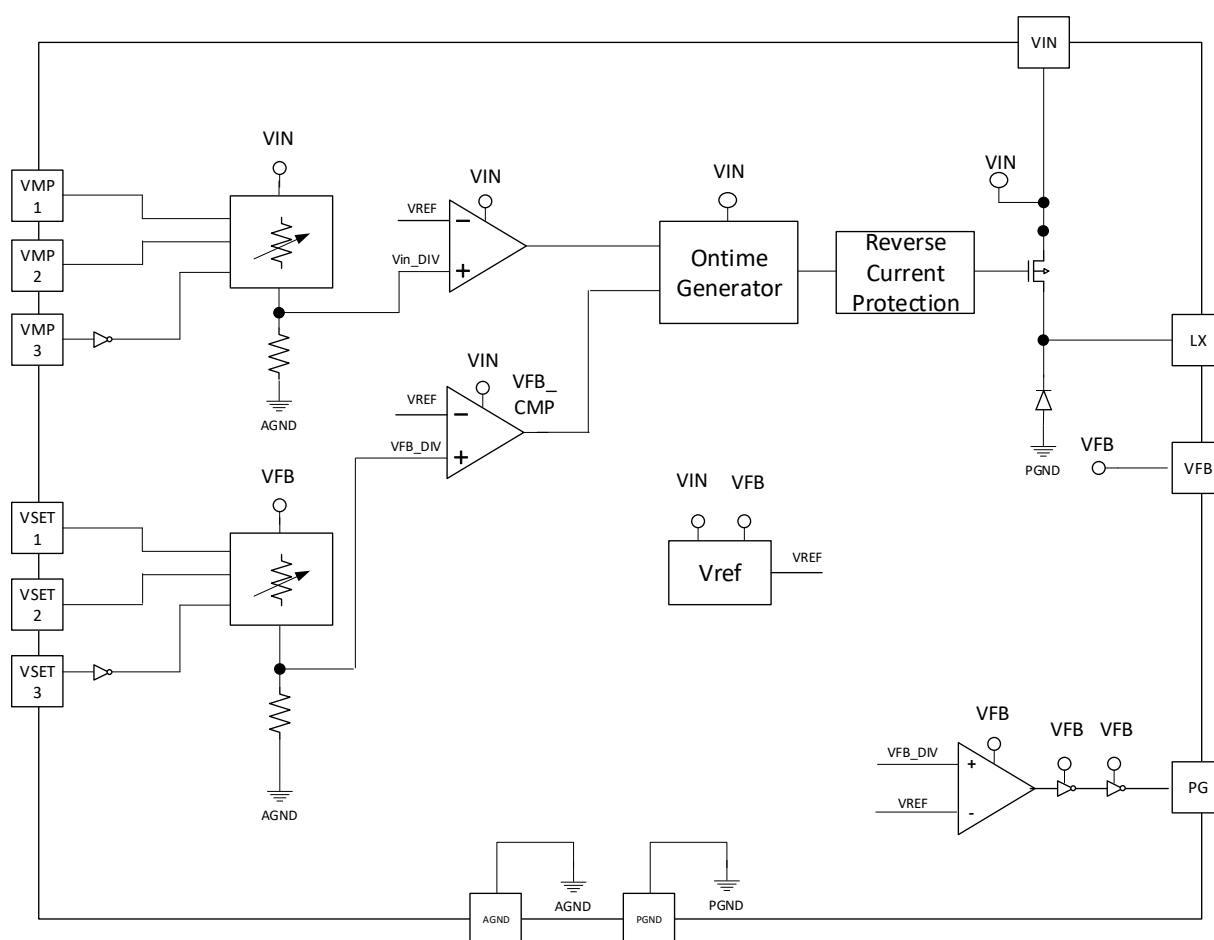

xxx: Select the ideal combination of the set output voltage ( $V_{SET}$ ) and the set maximum power point control voltage ( $V_{MPSET}$ ) from the code number starting from 001.

Refer to CODE LIST for lineup.

When use the PG function, put the  $V_{SET}$  voltage 2.5 V or higher.

It is recommended to set as  $V_{MPSET} \geq V_{SET} + 0.5 \text{ V}$ .

## BLOCK DIAGRAM

R1801K Block Diagram

## PIN DESCRIPTION

**DFN (PLP) 2730-12 Pin Configuration**

- <sup>(1)</sup> The tab on the bottom of the package enhances thermal performance and is electrically connected to GND (substrate level).  
It is recommended that the tab be connected to the ground plane on the board, or otherwise be left floating.

### DFN(PLP)2730-12 Pin Description

Pin No.	Symbol	Description
1	AGND	Analog Ground Pin
2	VMP1	Maximum Power Point Control Voltage Adjustment Pin 1
3	VMP2	Maximum Power Point Control Voltage Adjustment Pin 2
4	VMP3	Maximum Power Point Control Voltage Adjustment Pin 3
5	VSET1	Output Voltage Adjustment Pin 1
6	VSET2	Output Voltage Adjustment Pin 2
7	VSET3	Output Voltage Adjustment Pin 3
8	PG	Power Good Pin
9	VFB	Output Voltage Pin
10	PGND	Power Ground Pin
11	LX	DC/DC Switching Pin
12	VIN	Pin for Connecting Photovoltaic Element

## ABSOLUTE MAXIMUM RATINGS

### Absolute Maximum Ratings

Symbol	Parameter	Rating	Unit
$V_{IN}$	VIN Pin Voltage	-0.3 to 6.5	V
$V_{LX}$	LX Pin Voltage	-0.3 to $V_{IN} + 0.3$	V
$V_{VFB}$	VFB Pin Voltage	-0.3 to 6.5	V
$V_{VMP1}$	VMP1 Pin Voltage	-0.3 to 6.5	V
$V_{VMP2}$	VMP2 Pin Voltage	-0.3 to 6.5	V
$V_{VMP3}$	VMP3 Pin Voltage	-0.3 to 6.5	V
$V_{VSET1}$	VSET1 Pin Voltage	-0.3 to 6.5	V
$V_{VSET2}$	VSET2 Pin Voltage	-0.3 to 6.5	V
$V_{VSET3}$	VSET3 Pin Voltage	-0.3 to 6.5	V
$V_{PG}$	Power Good Pin	-0.3 to 6.5	V
$P_D$	Power Dissipation	Refer to Appendix "POWER DISSIPATION"	
$T_j$	Junction Temperature Range	-40 to 85	°C
$T_{stg}$	Storage Temperature Range	-55 to 125	°C

### ABSOLUTE MAXIMUM RATINGS

Electronic and mechanical stress momentarily exceeded absolute maximum ratings may cause permanent damage and may degrade the lifetime and safety for both device and system using the device in the field. The functional operation at or over these absolute maximum ratings is not assured.

## RECOMMENDED OPERATING CONDITIONS

### Recommended Operating Conditions

Symbol	Parameter	Rating	Unit
$V_{IN}$	Input Voltage	2.3 to 5.5	V
$T_a$	Operating Temperature Range	-40 to 85	°C

### RECOMMENDED OPERATING CONDITIONS

All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

## ELECTRICAL CHARACTERISTICS

The specifications surrounded by   are guaranteed by design engineering at  $-40^{\circ}\text{C} \leq T_a \leq 85^{\circ}\text{C}$ .

### R1801K Electrical Characteristics

( $T_a = 25^{\circ}\text{C}$ )

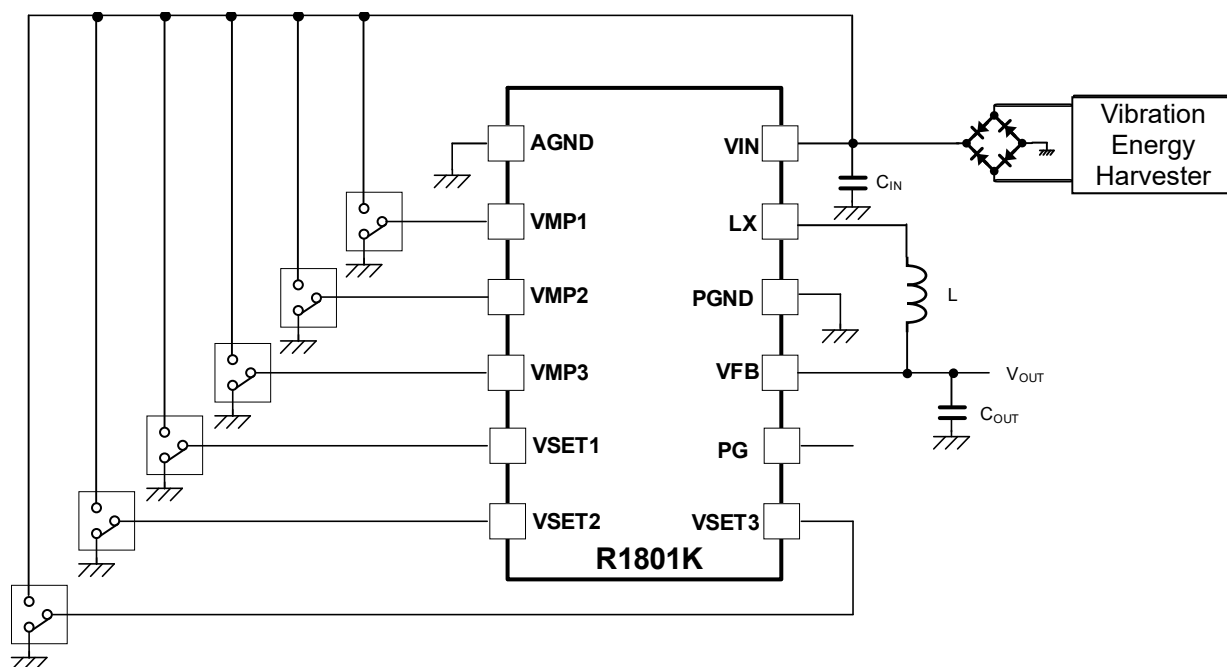

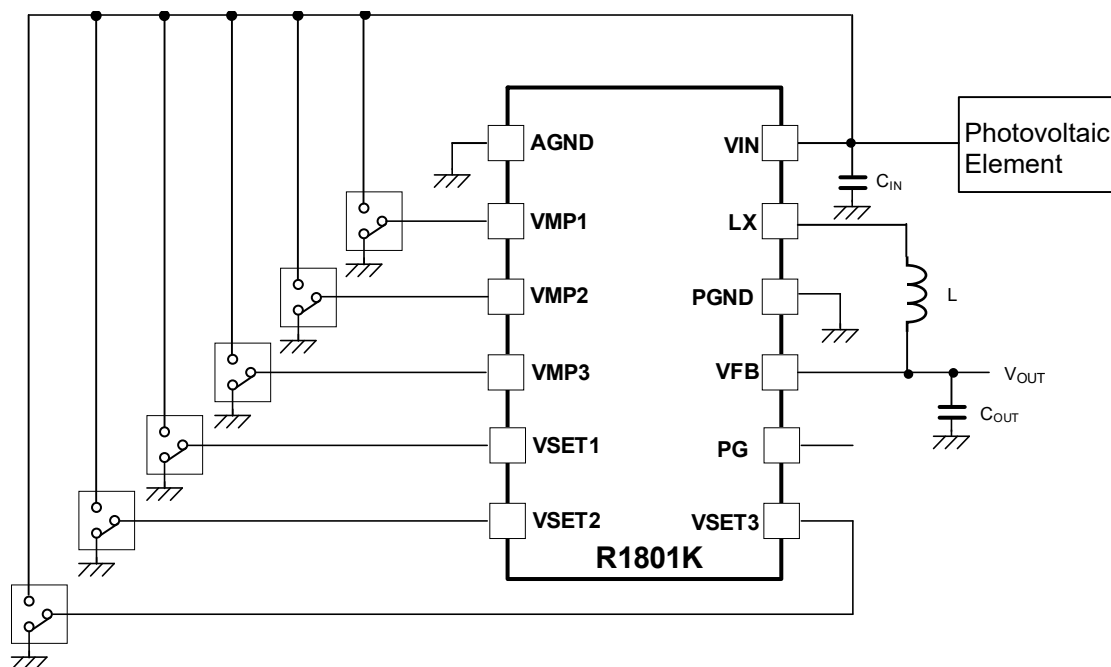

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
$V_{\text{OUT}}$	Output Voltage	$V_{\text{IN}} \geq V_{\text{SET}} + 0.5 \text{ V}$ , $V_{\text{VSET1} \sim 3} = \text{"L"}$ , at no load	$\frac{V_{\text{SET}}}{\times 0.97}$		$\frac{V_{\text{SET}}}{\times 1.03}$	V
		$V_{\text{IN}} \geq V_{\text{SET}} + 0.5 \text{ V}$ , $V_{\text{VSET1} \sim 3} \neq \text{"L"}$ , at no load	$\frac{V_{\text{SET}}}{\times 0.96}$		$\frac{V_{\text{SET}}}{\times 1.04}$	
$I_{\text{Q}}$	Operating Quiescent Current	$V_{\text{IN}} = 5.0 \text{ V}$ , $V_{\text{VFB}} = 3.0 \text{ V}$ , device not switching VFB pin current is converted by $V_{\text{IN}}$ current		200	420	nA
$V_{\text{MP}}^*$	Accuracy of Maximum Power Point Control Voltage	$V_{\text{VFB}} = 0 \text{ V}$	$\frac{V_{\text{MP}}^*}{-200}$		$\frac{V_{\text{MP}}^*}{+200}$	mV
$V_{\text{PGH}}$	PG"H" Detection Voltage	$V_{\text{IN}} = 5.5 \text{ V}$ , $V_{\text{FB}}$ rising	$\frac{V_{\text{OUT}}}{\times 0.845}$	$V_{\text{out}} \times 0.9$	$\frac{V_{\text{OUT}}}{\times 0.955}$	V
$V_{\text{PGL}}$	PG"L" Detection Voltage	$V_{\text{IN}} = 5.5 \text{ V}$ , $V_{\text{FB}}$ falling	1.8	1.9	2.19	V
$I_{\text{VMP1 to 3}}$	VMP1 to 3 Pin "H"/"L" Leakage Current	$V_{\text{IN}} = 5.5 \text{ V}$ , $V_{\text{VMP1 to 3}} = 5.5 \text{ V} / 0 \text{ V}$			0.1	uA
$I_{\text{VSET1 to 3}}$	VSET1 to 3 Pin "H"/"L" Leakage Current	$V_{\text{IN}} = 5.5 \text{ V}$ , $V_{\text{VSET1 to 3}} = 5.5 \text{ V} / 0 \text{ V}$			0.1	uA
$I_{\text{LEAK}}$	Output Driver "H"/"L" Leakage Current	$V_{\text{IN}} = 5.5 \text{ V}$ , $V_{\text{LX}} = 5.5 \text{ V} / 0 \text{ V}$			0.1	uA

All test items listed under Electrical Characteristics are done under the pulse load condition ( $T_j \approx T_a = 25^{\circ}\text{C}$ ).

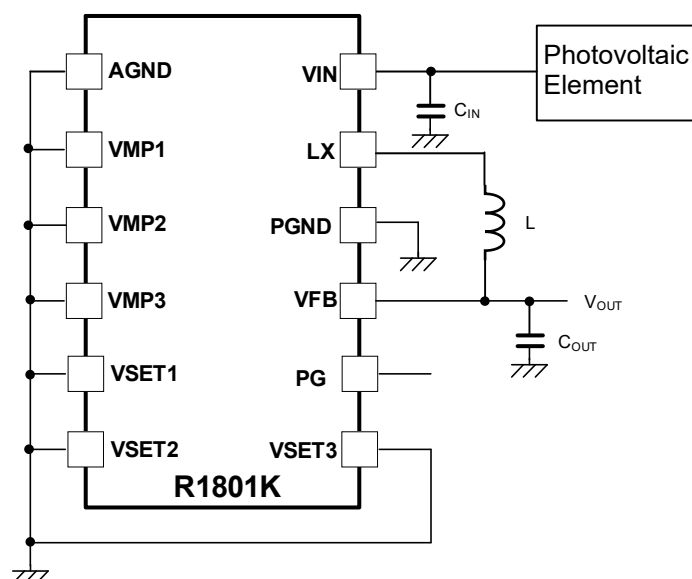

Test circuit is operated with "Open Loop Control" ( $\text{GND} = 0 \text{ V}$ ), unless otherwise specified.

\* The Accuracy of Maximum Power Point Control Voltage also includes an externally set voltage.

## TYPICAL APPLICATION CIRCUIT

R1801K Typical Application Circuit

R1801K Typical application circuit when external function is noused

**Recommended External Components**

Symbol	Descriptions
C <sub>IN</sub>	Ceramic Capacitor 10 μF or higher
C <sub>OUT</sub>	Ceramic Capacitor 47 μF or higher, or Ceramic Capacitor 10 μF or higher and Large-capacity Electrical Storage Device
L	Inductor 22 μH

**Recommended Large-capacity Electrical Storage Devices**

Manufacturer	Product	Part #	Capacity	Type	Notes
TDK	CeraCharge™	BCT1812M101AG	100 μAh	All-solid-state Li-ion	CeraCharge™ is a trademark of TDK
Nichicon	SLB series	SLB03070LR35	350 μAh	Li-ion	
NGK	EnerCera®	ET1210C-R ET2016C-R ET271704P-H	5 mAh 25 mAh 5 mAh	Li-ion	EnerCera® is a trademark of NGK
Murata	CT series	CT04120	3 mAh	Li-ion	

(Note)

When capacitance value of ceramic capacitor is small, output ripple becomes large, then the output ripple may exceed the voltage rating of storage battery or subsequent devices.

While considering ESR of storage battery, adjust values of set voltage and ceramic capacitor as not exceeding the voltage rating.

Adjust ceramic capacitor and output ripple values referencing the formula below.

$$\text{output ripple voltage[V]} = 0.45[\mu\text{C}] \div C[\mu\text{F}] (\text{ceramic capacitor effective capacitance value})$$

## TECHNICAL NOTES

The performance of a power source circuit using this device is highly dependent on a peripheral circuit. A peripheral component or the device mounted on PCB should not exceed a rated voltage, a rated current or a rated power. When designing a peripheral circuit, please be fully aware of the following points.

- Use a ceramic capacitor with a lower equivalent series resistance (ESR). A capacitor of 10  $\mu\text{F}$  or higher for  $C_{\text{IN}}$  between VIN and GND pins is recommended. A ceramic capacitor of 47  $\mu\text{F}$  or higher, or a ceramic capacitor of 10  $\mu\text{F}$  or higher and a large-capacity storage device is recommended for  $C_{\text{OUT}}$ . Stable operation is guaranteed if the capacitor is above the recommended capacitance value without bias in the operating temperature range. Care must be taken with insulation resistance. Capacitors with low insulation resistance increase leakage current and are not recommended for systems. (Refer to *Measurement Components for Typical Characteristics* in the datasheet)
- It is recommended that the inductor has a rated current (400mA or more), equivalent series resistance, and DC superimposition characteristics that are equal to or higher than spec used when measuring the typical characteristic in the datasheet. If the equivalent series resistance is large or the DC superimposition characteristics are poor, the efficiency will be inefficient, additionally note that if the rating is too low, the inductor may be damaged.
- When an intermediate voltage other than VIN or GND is input to the VMP1 to 3 and VSET1 to 3 pins, the supply current may increase due to the cross-conduction current of the IC internal logic circuit. When the VMP1 to 3 and VSET1 to 3 pins are open, the maximum power point control voltage and VSET voltage may vary. When using the IC, connect the VMP1 to 3 and VSET1 to 3 pins to "VIN" or "GND".

## THEORY OF OPERATION

### BUCK CONVERTER OPERATION

The basic buck DC / DC converter operation is illustrated in the following figures.

The buck DC / DC converter charges energy in the inductor when the high-side transistor turns ON, and discharges the energy from the inductor when the high-side transistor turns OFF and controls with less energy loss, so that a lower output voltage ( $V_{OUT}$ ) than the input voltage ( $V_{IN}$ ) is obtained.

Basic Circuit

Current through Inductor

- Step1.** The high-side transistor turns on,  $I_L = i1$  flows, the inductor is charged with energy, and  $C_{OUT}$  is charged to supply the output current ( $I_{OUT}$ ). At this moment,  $I_L = i1$  increases from  $I_L = I_{LMIN} = 0$  in proportion to the ON time of the high-side transistor ( $t_{ONHS}$ ), and reaches the maximum value of the current flowing through the inductor ( $I_{LMAX}$ ).
- Step2.** When the high-side transistor turns OFF, the inductor flows current  $I_L = i2$  from the diode to maintain  $I_L = I_{LMAX}$ .
- Step3.**  $I_L = i2$  decreases gradually, after the ON time of the low-side transistor ( $t_{ONLS}$ ), becomes  $I_L = I_{LMIN} = 0$ .

**ADJUSTABLE MAXIMUM POWER POINT CONTROL / OUTPUT VOLTAGE**

When the pin voltage of VMP1 to 3 and VSET1 to 3 is "H", the maximum power voltage and VSET voltage are adjustable externally. 1 corresponds to -100 mV, 2 corresponds to -200 mV and 3 corresponds to +300 mV, and Typ.  $\pm 300$  mV is adjustable. However, setting all bits to "H" is prohibited.

Due to the circuit configuration, the "H" / "L" level threshold voltage of each pin depends on the input voltage. When setting to "H" voltage, pull up both of VMP / VSET to the input voltage.

When setting to "L" voltage, short it to GND.

All adjustment pins should not be OPEN, use them as "H" / "L" levels.

Regulated Voltage Logic Table of Maximum Power Point Control Voltage

Regulated Voltage	VMP1	VMP2	VMP3
- 300 mV	H	H	L
- 200 mV	L	H	L
- 100 mV	H	L	L
0 mV	L	L	L
100 mV	L	H	H
200 mV	H	L	H
300 mV	L	L	H
Prohibited	H	H	H

Regulated Voltage Logic Table of Output Voltage

Regulated Voltage	VSET1	VSET2	VSET3
- 300 mV	H	H	L
- 200 mV	L	H	L
- 100 mV	H	L	L
0 mV	L	L	L
100 mV	L	H	H
200 mV	H	L	H
300 mV	L	L	H
Prohibited	H	H	H

## MAXIMUM POWER POINT CONTROL

R1801K transfers power to  $C_{OUT}$  at maximum power voltage ( $V_{MP}$ ), which is the operating point of the maximum amount of power generation of a solar cell. After R1801K receives power from the solar cell, the input voltage increases and when it reaches the  $V_{MP}$ , a switching starts and the R1801K transfers power to  $C_{OUT}$ .

When a power transfer amount exceeds the supplied power from the solar cell, the input voltage decreases by the switching. When the  $V_{IN}$  drops below the  $V_{MP}$  voltage, the next switching is stopped, the  $C_{IN}$  is charged by the solar cell, and the  $V_{IN}$  rises. When  $V_{IN}$  reaches the  $V_{MP}$  voltage, it transfers power to  $C_{OUT}$  again.

When the input voltage reaches the  $V_{MP}$  again, the R1801K transfers power to  $C_{OUT}$ . By repeating this operation enables transferring power to  $C_{OUT}$  while maintaining the operating point of the maximum amount of power generation of the solar cell.

## OPERATION IN STABLE STATE

Output Voltage Waveforms Near the Set Voltage

This section explains the R1801K's operation when the output voltage rises to the set voltage. When the output voltage exceeds the set voltage, the R1801K stops switching even if the  $V_{IN}$  voltage exceeds the  $V_{MP}$  voltage. After that, switching resumes when the output voltage decreases below the  $V_{OUT}$  voltage due to the load etc. R1801K repeats the above operation to keep the output voltage at the set voltage.

## POWER GOOD (PG) FUNCTION

When switching starts and the  $V_{OUT}$  voltage exceeds the PG"H" voltage ( $V_{OUT} \times 90\%$ ), after 4 ms (Typ.), the "H" signal is output from the PG pin. The output status can be determined by the PG pin voltage, enabling sequence control.

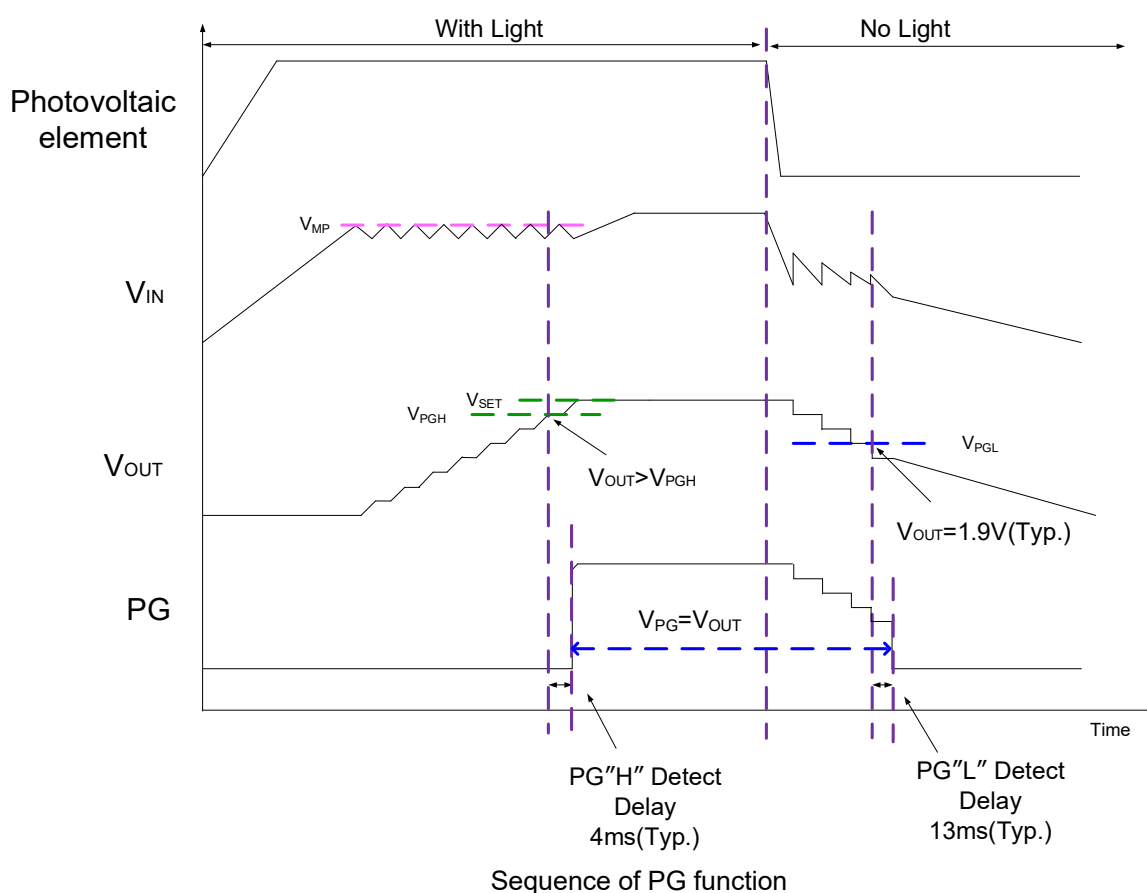

Once the PG pin voltage has risen, the "L" signal is not output until the  $V_{OUT}$  voltage decreases below 1.9 V (Typ.) or lower.

During the period of PG = "H", the same voltage as the  $V_{OUT}$  voltage is output.

In addition, since the PG function operates using the FB pin's voltage as the power supply, it works regardless whether  $V_{IN}$  is supplied or not.

For example, in a system that operates intermittently several times a day, if a large-capacity storage device is connected to the  $C_{OUT}$ , if the  $V_{OUT}$  voltage is 1.9 V, the PG will continue to hold the H voltage even if the  $V_{IN}$  disappears.

However, in order to secure the minimum operating voltage of the PG function, set the  $V_{SET}$  voltage to 2.5 V or higher when using the PG function.

## REVERSE CURRENT PROTECTION

The R1801K has a reverse current protection to prevent the electric charge stored in the  $C_{OUT}$  or the large-capacity power storage device connected to the VFB pin from flowing back to the IC even if the light irradiation when the solar cell is cut off. This keeps the charge stored in the  $C_{OUT}$  and large-capacity power storage devices for a long time.

When the light is cut off, the charge stored in the  $C_{IN}$  is consumed as the supply current to the IC, and the input voltage  $V_{IN}$  slowly drops. When the input voltage becomes lower than the output voltage  $V_{OUT}$ , the reverse current protection works, so even if  $V_{IN} \leq V_{OUT}$ , the charge stored in the  $C_{OUT}$  or the large-capacity power storage device does not flow back to the IC side.

An input voltage of 2 V or higher is required for the reverse current protection to operate. When the input voltage drops below 2 V, the reverse current protection is canceled and the charge on the output side flows back to the input side through the IC.

If  $V_{IN} \geq 2V$ , the reverse current protection will work again. Normally, the backflow of charge from the output to the input is completed in a short time, and the input voltage rises to near the output voltage. By repeating this, the input voltage and output voltage will decrease.

Due to variations in the reverse current protection detection threshold, here is a possibility to be detected as the reverse status even when  $V_{IN} = V_{OUT}$ . It is recommended to set as  $V_{MPSET} \geq V_{SET} + 0.5 V$ .

## APPLICATION INFORMATION

### CODE LIST

Product Name	V <sub>SET</sub> (V <sub>SET1~3</sub> ="L") [V]	V <sub>MP</sub> (V <sub>MP1~3</sub> ="L") [V]

## TYPICAL CHARACTERISTICS

Note: Typical Characteristics are intended to be used as reference data; they are not guaranteed.

### 1) Efficiency vs. Output Current

$V_{SET} = 2.8 \text{ V}$

### 2) Quiescent Current vs. Temperature

$V_{IN} = 5.0 \text{ V}$ ,  $V_{FB} = 3.0 \text{ V}$

### 3) Output Voltage vs. Output Current

$V_{SET} = 2.8 \text{ V}$

### 4) Minimum Starting Power

$V_{SET} = 3.3 \text{ V}$ ,  $I_{IN} = 222 \text{ nA}$

### 5) Start with Power Generation Element

Using R1801K003A,

Power Generation Element= AM-1801

$V_{MP} = 4.0 \text{ V}$ ,  $V_{SET} = 3.3 \text{ V}$

1. The products and the product specifications described in this document are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to Ricoh sales representatives for the latest information thereon.
2. The materials in this document may not be copied or otherwise reproduced in whole or in part without prior written consent of Ricoh.
3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.
4. The technical information described in this document shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under Ricoh's or any third party's intellectual property rights or any other rights.
5. The products listed in this document are intended and designed for use as general electronic components in standard applications (office equipment, telecommunication equipment, measuring instruments, consumer electronic products, amusement equipment etc.). Those customers intending to use a product in an application requiring extreme quality and reliability, for example, in a highly specific application where the failure or misoperation of the product could result in human injury or death (aircraft, spacevehicle, nuclear reactor control system, traffic control system, automotive and transportation equipment, combustion equipment, safety devices, life support system etc.) should first contact us.
6. We are making our continuous effort to improve the quality and reliability of our products, but semiconductor products are likely to fail with certain probability. In order to prevent any injury to persons or damages to property resulting from such failure, customers should be careful enough to incorporate safety measures in their design, such as redundancy feature, fire containment feature and fail-safe feature. We do not assume any liability or responsibility for any loss or damage arising from misuse or inappropriate use of the products.
7. Anti-radiation design is not implemented in the products described in this document.
8. The X-ray exposure can influence functions and characteristics of the products. Confirm the product functions and characteristics in the evaluation stage.
9. WLCSP products should be used in light shielded environments. The light exposure can influence functions and characteristics of the products under operation or storage.
10. There can be variation in the marking when different AOI (Automated Optical Inspection) equipment is used. In the case of recognizing the marking characteristic with AOI, please contact Ricoh sales or our distributor before attempting to use AOI.
11. Please contact Ricoh sales representatives should you have any questions or comments concerning the products or the technical information.

**Ricoh is committed to reducing the environmental loading materials in electrical devices with a view to contributing to the protection of human health and the environment.**

Ricoh has been providing RoHS compliant products since April 1, 2006 and Halogen-free products since April 1, 2012.
