

# SiT9366

1 MHz to 220 MHz Ultra-low Jitter Differential Oscillator

## Description

The [SiT9366](#) is a 1 MHz to 220 MHz differential MEMS XO engineered for low-jitter applications. Utilizing SiTime's unique DualMEMS™ temperature sensing and TurboCompensation™ technology, the SiT9366 delivers exceptional dynamic performance by providing resistance to airflow, thermal gradients, shock and vibration. This device also integrates multiple on-chip regulators to filter power supply noise, eliminating the need for a dedicated external LDO.

The SiT9366 can be factory programmed for any combination of frequency, stability, voltage, and output signaling. Programmability enables designers to optimize clock configurations while eliminating long lead times and customization costs associated with quartz devices where each frequency is custom built.

The wide frequency range and programmability makes this device ideal for telecom, networking, and industrial applications that require a variety of frequencies and operate in noisy environments.

Refer to [Manufacturing Notes](#) for proper reflow profile, tape and reel dimension, and other manufacturing related information.

## Features

- Any frequency between 1 MHz and 220 MHz accurate to 6 decimal places  
(For additional frequencies, refer to [SiT9367](#) and [SiT9365](#) datasheets)
- LVPECL, Low-swing LVPECL, LVDS and HCSL output signaling
- 0.1 ps RMS phase jitter (random) for Ethernet applications
- Frequency stability as low  $\pm 10$  ppm
- Wide temperature ranges from  $-40^{\circ}\text{C}$  to  $105^{\circ}\text{C}$
- Industry-standard packages:  $7.0 \times 5.0 \text{ mm}^2$ ,  $5.0 \times 3.2 \text{ mm}^2$ ,  $3.2 \times 2.5 \text{ mm}^2$  packages

## Applications

- 10/40/100 Gbps Ethernet, SONET, SATA, SAS, Fibre Channel
- Telecom, networking, instrumentation, storage, servers

## Electrical Characteristics

All Min and Max limits in the Electrical Characteristics tables are specified over temperature and rated operating voltage with standard output termination show in the termination diagrams. Typical values are at 25°C and nominal supply voltage.

**Table 6. Pin Description**

Pin	Map	Functionality	
1	OE/NC	Output Enable (OE)	H <sup>[5]</sup> : specified frequency output L: output is high impedance
		Non Connect (NC)	H or L or Open: No effect on output frequency or other device functions
2	NC	NA	No Connect; Leave it floating or connect to GND for better heat dissipation
3	GND	Power	V <sub>dd</sub> Power Supply Ground
4	OUT+	Output	Oscillator output
5	OUT-	Output	Complementary oscillator output
6	V <sub>dd</sub>	Power	Power supply voltage <sup>[6]</sup>

**Figure 3. Pin Assignments**

**Notes:**

- 5. In OE mode, a pull-up resistor of 10 kΩ or less is recommended if pin 1 is not externally driven.
- 6. A capacitor of value 0.1 μF or higher between V<sub>DD</sub> and GND is required. An additional 10 μF capacitor between V<sub>DD</sub> and GND is required for the best phase jitter performance.

### Table 7. Absolute Maximum Ratings

Attempted operation outside the absolute maximum ratings may cause permanent damage to the part. Actual performance of the IC is only guaranteed within the operational specifications, not at absolute maximum ratings.

**Notes:**

9. Top Marking: Y denotes manufacturing origin and XXXX denotes manufacturing lot number. The value of "Y" will depend on the assembly location of the device.
10. A capacitor of value 0.1 μF or higher between VDD and GND is required. An additional 10 μF capacitor between VDD and GND is required for the best phase jitter performance.
11. The center pad has no electrical function. Soldering down the center pad to the GND is recommended for best thermal dissipation, but is optional.
