

# High-Current, High- & Low-Side, Gate-Drive IC

## FAN7392

### Description

The FAN7392 is a monolithic high- and low-side gate drive IC, that can drive high-speed MOSFETs and IGBTs that operate up to +600 V. It has a buffered output stage with all NMOS transistors designed for high pulse current driving capability and minimum cross-conduction. ON Semiconductor's high-voltage process and common-mode noise canceling techniques provide stable operation of the high-side driver under high dv/dt noise circumstances. An advanced level-shift circuit offers high-side gate driver operation up to  $V_S = -9.8$  V (typical) for  $V_{BS} = 15$  V. Logic inputs are compatible with standard CMOS or LSTTL output, down to 3.3 V logic. The UVLO circuit prevents malfunction when  $V_{CC}$  and  $V_{BS}$  are lower than the specified threshold voltage. The high-current and low-output voltage drop feature makes this device suitable for half- and full-bridge inverters, like switching-mode power supply and high-power DC-DC converter applications.

### Features

- Floating Channel for Bootstrap Operation to +600 V
- 3 A/3 A Sourcing/Sinking Current Driving Capability
- Common-Mode dv/dt Noise Canceling Circuit
- 3.3 V Logic Compatible
- Separate Logic Supply ( $V_{DD}$ ) Range from 3.3 V to 20 V
- Under-Voltage Lockout for  $V_{CC}$  and  $V_{BS}$
- Cycle-by-Cycle Edge-Triggered Shutdown Logic
- Matched Propagation Delay for Both Channels
- Outputs In-phase with Input Signals
- Available in 14-DIP and 16-SOP (Wide) Packages
- This is a Pb-Free Device

### Applications

- High-Speed Power MOSFET and IGBT Gate Driver
- Server Power Supply
- Uninterrupted Power Supply (UPS)
- Telecom System Power Supply
- Distributed Power Supply
- Motor Drive Inverter

# FAN7392

## ABSOLUTE MAXIMUM RATINGS (T<sub>A</sub> = 25°C, unless otherwise noted)

Symbol	Characteristics	Min	Max	Unit
V <sub>B</sub>	High-Side Floating Supply Voltage	-0.3	625.0	V
V <sub>S</sub>	High-Side Floating Offset Voltage	V <sub>B</sub> - 25.0	V <sub>B</sub> + 0.3	V
V <sub>HO</sub>	High-Side Floating Output Voltage	V <sub>S</sub> - 0.3	V <sub>B</sub> + 0.3	V
V <sub>CC</sub>	Low-Side Supply Voltage	-0.3	25.0	V
V <sub>LO</sub>	Low-Side Floating Output Voltage	-0.3	V <sub>CC</sub> + 0.3	V
V <sub>DD</sub>	Logic Supply Voltage	-0.3	V <sub>SS</sub> + 25.0	V
V <sub>SS</sub>	Logic Supply Offset Voltage	V <sub>CC</sub> - 25.0	V <sub>CC</sub> + 0.3	V
V <sub>IN</sub>	Logic Input Voltage (HIN, LIN and SD)	V <sub>SS</sub> - 0.3	V <sub>DD</sub> + 0.3	V
dV <sub>S</sub> /dt	Allowable Offset Voltage Slew Rate	-	±50	V/ns
P <sub>D</sub>	Power Dissipation (Note 1, 2, 3)	14-PDIP	1.6	W
		16-SOP	1.3	
θ <sub>JA</sub>	Thermal Resistance	14-PDIP	75	°C/W
		16-SOP	95	
T <sub>J</sub>	Maximum Junction Temperature	-	+150	°C
T <sub>STG</sub>	Storage Temperature	-55	+150	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Mounted on 76.2 x 114.3 x 1.6 mm PCB (FR-4 glass epoxy material).
2. Refer to the following standards:  
 JESD51-2: Integral circuits thermal test method environmental conditions – natural convection; and  
 JESD51-3: Low effective thermal conductivity test board for leaded surface-mount packages.
3. Do not exceed power dissipation (P<sub>D</sub>) under any circumstances.

## RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Min	Max	Unit
V <sub>B</sub>	High-Side Floating Supply Voltage	V <sub>S</sub> + 10	V <sub>S</sub> + 20	V
V <sub>S</sub>	High-Side Floating Supply Offset Voltage	6 - V <sub>CC</sub>	600	V
V <sub>HO</sub>	High-Side Output Voltage	V <sub>S</sub>	V <sub>B</sub>	V
V <sub>CC</sub>	Low-Side Supply Voltage	10	20	V
V <sub>LO</sub>	Low-Side Output Voltage	0	V <sub>CC</sub>	V
V <sub>DD</sub>	Logic Supply Voltage	V <sub>SS</sub> + 3	V <sub>SS</sub> + 20	V
V <sub>SS</sub>	Logic Supply Offset Voltage	-5	5	V
V <sub>IN</sub>	Logic Input Voltage	V <sub>SS</sub>	V <sub>DD</sub>	V
T <sub>A</sub>	Operating Ambient Temperature	-40	+125	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

SWITCHING TIME DEFINITIONS (continued)

Figure 32. Shutdown Waveform Definition

Figure 33. Delay Matching Waveform Definitions

**APPLICATION INFORMATION**

**Negative  $V_S$  Transient**

The bootstrap circuit has the advantage of being simple and low cost, but has some limitations. The biggest difficulty with this circuit is the negative voltage present at the emitter of the high-side switching device when high-side switch is turned-off in half-bridge application.

If the high-side switch, Q1, turns-off while the load current is flowing to an inductive load, a current commutation occurs from high-side switch, Q1, to the diode, D2, in parallel with the low-side switch of the same inverter leg. Then the negative voltage present at the emitter of the high-side switching device, just before the freewheeling diode, D2, starts clamping, causes load current to suddenly flow to the low-side freewheeling diode, D2, as shown in Figure 34.

**Figure 34. Half-Bridge Application Circuits**

This negative voltage can be trouble for the gate driver's output stage, there is the possibility to develop an over-voltage condition of the bootstrap capacitor, input signal missing and latch-up problems because it directly affects the source  $V_S$  pin of the gate driver, as shown in Figure 35. This undershoot voltage is called "negative  $V_S$  transient".

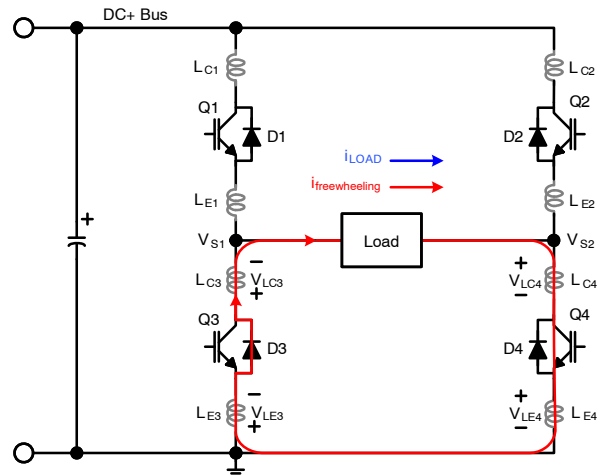

**Figure 35.  $V_S$  Waveforms During Q1 Turn-Off**

Figure 36 and Figure 37 show the commutation of the load current between high-side switch, Q1, and low-side freewheeling diode, D3, in same inverter leg. The parasitic inductances in the inverter circuit from the die wire bonding to the PCB tracks are jumped together in  $L_C$  and  $L_E$  for each IGBT. When the high-side switch, Q1, and low-side switch, Q4, are turned on, the  $V_{S1}$  node is below DC+ voltage by the voltage drops associated with the power switch and the parasitic inductances of the circuit due to load current is shown in Figure 36. When the high-side switch, Q1, is turned off and Q4, remained turned on, the load current to flows the low-side freewheeling diode, D3, due to the inductive load connected to  $V_{S1}$  as shown in Figure 37. The current flows from ground (which is connected to the COM pin of the gate driver) to the load and the negative voltage present at the emitter of the high-side switching device.

In this case, the COM pin of the gate driver is at a higher potential than the  $V_S$  pin due to the voltage drops associated with freewheeling diode, D3, and parasitic elements,  $L_{C3}$  and  $L_{E3}$ .

**Figure 36. Q1 and Q4 Turn-On**

**Figure 37. Q1 Turn-Off and D3 Conducting**

## FAN7392

The FAN7392 has a negative  $V_S$  transient performance curve, as shown in Figure 38.

**Figure 38. Negative  $V_S$  Transient Characteristic**

Even though the FAN7392 has been shown able to handle these negative  $V_S$  transient conditions, it is strongly recommended that the circuit designer limit the negative  $V_S$  transient as much as possible by careful PCB layout to minimize the value of parasitic elements and component use. The amplitude of negative  $V_S$  voltage is proportional to the parasitic inductances and the turn-off speed,  $di/dt$ , of the switching device.

### GENERAL GUIDELINES

#### Printed Circuit Board Layout

The layout recommended for minimized parasitic elements is as follows:

- Direct tracks between switches with no loops or deviation.
- Avoid interconnect links. These can add significant inductance.
- Reduce the effect of lead-inductance by lowering package height above the PCB.
- Consider co-locating both power switches to reduce track length.

### ORDERING INFORMATION

Device	Operating Temperature Range	Package	Shipping <sup>†</sup>
FAN7392N	-40°C~125°C	PDIP-14 14-PDIP (Pb-Free)	1500 Units / Tube
FAN7392MX		SOIC-16 16-SOP (Pb-Free)	1000 / Tape & Reel

<sup>†</sup>For information on tape and reel specifications, including part orientation and tape sizes, please refer to our Tape and Reel Packaging Specifications Brochure, BRD8011/D.

- To minimize noise coupling, the ground plane should not be placed under or near the high-voltage floating side.
- To reduce the EM coupling and improve the power switch turn-on/off performance, the gate drive loops must be reduced as much as possible.

### Placement of Components

The recommended placement and selection of component as follows:

- Place a bypass capacitor between the  $V_{DD}$  and  $V_{SS}$  pins. A ceramic 1  $\mu$ F capacitor is suitable for most applications. This component should be placed as close as possible to the pins to reduce parasitic elements.
- The bypass capacitor from  $V_{CC}$  to COM supports both the low-side driver and bootstrap capacitor recharge. A value at least ten times higher than the bootstrap capacitor is recommended.
- The bootstrap resistor,  $R_{BOOT}$ , must be considered in sizing the bootstrap resistance and the current developed during initial bootstrap charge. If the resistor is needed in series with the bootstrap diode, verify that  $V_B$  does not fall below COM (ground). Recommended use is typically 5~10  $\Omega$  that increase the  $V_{BS}$  time constant. If the voltage drop of bootstrap resistor and diode is too high or the circuit topology does not allow a sufficient charging time, a fast recovery or ultra-fast recovery diode can be used.
- The bootstrap capacitor,  $C_{BOOT}$ , uses a low-ESR capacitor, such as ceramic capacitor.

It is strongly recommended that the placement of components is as follows:

- Place components tied to the floating voltage pins ( $V_B$  and  $V_S$ ) near the respective high-voltage portions of the device and the FAN7392. NC (not connected) pins in this package maximize the distance between the high-voltage and low-voltage pins (see Figure 5).
- Place and route for bypass capacitors and gate resistors as close as possible to gate drive IC.
- Locate the bootstrap diode,  $D_{BOOT}$ , as close as possible to bootstrap capacitor,  $C_{BOOT}$ .
- The bootstrap diode must use a lower forward voltage drop and minimal switching time as soon as possible for fast recovery or ultra-fast diode.

ON Semiconductor and are trademarks of Semiconductor Components Industries, LLC dba ON Semiconductor or its subsidiaries in the United States and/or other countries. ON Semiconductor reserves the right to make changes without further notice to any products herein. ON Semiconductor makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does ON Semiconductor assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. ON Semiconductor does not convey any license under its patent rights nor the rights of others.

ON Semiconductor and  are trademarks of Semiconductor Components Industries, LLC dba ON Semiconductor or its subsidiaries in the United States and/or other countries. ON Semiconductor owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of ON Semiconductor's product/patent coverage may be accessed at [www.onsemi.com/site/pdf/Patent-Marking.pdf](http://www.onsemi.com/site/pdf/Patent-Marking.pdf). ON Semiconductor reserves the right to make changes without further notice to any products herein. ON Semiconductor makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does ON Semiconductor assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using ON Semiconductor products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by ON Semiconductor. "Typical" parameters which may be provided in ON Semiconductor data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. ON Semiconductor does not convey any license under its patent rights nor the rights of others. ON Semiconductor products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use ON Semiconductor products for any such unintended or unauthorized application, Buyer shall indemnify and hold ON Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that ON Semiconductor was negligent regarding the design or manufacture of the part. ON Semiconductor is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
