Description

The IDT71V016 is a 1,048,576-bit high-speed Static RAM organized as 64K x 16. It is fabricated using high-performance, high-reliability CMOS technology. This state-of-the-art technology, combined with innovative circuit design techniques, provides a cost-effective solution for high-speed memory needs.

The IDT71V016 has an output enable pin which operates as fast as 5ns, with address access times as fast as 10ns. All bidirectional inputs and outputs of the IDT71V016 are LVTTTL compatible and operation is from a single 3.3V supply. Fully static asynchronous circuitry is used, requiring no clocks or refresh for operation.

The IDT71V016 is packaged in a JEDEC standard 44-pin Plastic SOJ, a 44-pin TSOP Type II, and a 48-ball plastic 7 x 7 mm FBGA.

1. This parameter is guaranteed with the AC Load (Figure 2) by device characterization, but is not production tested.

Timing Waveform of Read Cycle No. 1^(1,2,3)

NOTES:

3834 drw 06

1. \overline{WE} is HIGH for Read Cycle.
2. Device is continuously selected, \overline{CS} is LOW.
3. \overline{OE} , \overline{BHE} , and \overline{BLE} are LOW.

Timing Waveform of Read Cycle No. 2⁽¹⁾

3834 drw 07

NOTES:

1. \overline{WE} is HIGH for Read Cycle.
2. Address must be valid prior to or coincident with the later of \overline{CS} , \overline{BHE} , or \overline{BLE} transition LOW; otherwise t_{AA} is the limiting parameter.
3. Transition is measured $\pm 200\text{mV}$ from steady state.

Timing Waveform of Write Cycle No. 1 (\overline{WE} Controlled Timing)^(1,2,4)

3834 drw 08

NOTES:

1. A write occurs during the overlap of a LOW \overline{CS} , LOW \overline{BHE} or \overline{BLE} , and a LOW \overline{WE} .
2. \overline{OE} is continuously HIGH. If during a \overline{WE} controlled write cycle \overline{OE} is LOW, t_{WP} must be greater than or equal to $t_{WHZ} + t_{OW}$ to allow the I/O drivers to turn off and data to be placed on the bus for the required t_{OW} . If \overline{OE} is HIGH during a \overline{WE} controlled write cycle, this requirement does not apply and the minimum write pulse is as short as the specified t_{WR} .
3. During this period, I/O pins are in the output state, and input signals must not be applied.
4. If the \overline{CS} LOW or \overline{BHE} and \overline{BLE} LOW transition occurs simultaneously with or after the \overline{WE} LOW transition, the outputs remain in a high-impedance state.
5. Transition is measured $\pm 200\text{mV}$ from steady state.

Timing Waveform of Write Cycle No. 2 ($\overline{\text{CS}}$ Controlled Timing)^(1,4)

Timing Waveform of Write Cycle No. 3 ($\overline{\text{BHE}}$, $\overline{\text{BLE}}$ Controlled Timing)^(1,4)

NOTES:

1. A write occurs during the overlap of a LOW $\overline{\text{CS}}$, LOW $\overline{\text{BHE}}$ or $\overline{\text{BLE}}$, and a LOW $\overline{\text{WE}}$.
2. $\overline{\text{OE}}$ is continuously HIGH. If during a $\overline{\text{WE}}$ controlled write cycle $\overline{\text{OE}}$ is LOW, t_{WP} must be greater than or equal to $t_{WHZ} + t_{BW}$ to allow the I/O drivers to turn off and data to be placed on the bus for the required t_{BW} . If $\overline{\text{OE}}$ is HIGH during a $\overline{\text{WE}}$ controlled write cycle, this requirement does not apply and the minimum write pulse is as short as the specified t_{WR} .
3. During this period, I/O pins are in the output state, and input signals must not be applied.
4. If the $\overline{\text{CS}}$ LOW or $\overline{\text{BHE}}$ and $\overline{\text{BLE}}$ LOW transition occurs simultaneously with or after the $\overline{\text{WE}}$ LOW transition, the outputs remain in a high-impedance state.
5. Transition is measured $\pm 200\text{mV}$ from steady state.
