## LATCH-UP RATINGS

Latch-up Current	100	mA
------------------	-----	----

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- Stresses beyond the absolute maximum ratings can lead to reduced reliability and damage.
- Excursions of input voltages may exceed the power supply level. As long as the common mode voltage [ $V_{CM} = (V_{IN+} + V_{IN-})/2$ ] remains within the specified range, the comparator will provide a stable output state. However, the maximum current through the ESD diodes of the input stage must strictly be observed.
- Input differential voltage is the non-inverting input terminal with respect to the inverting input terminal. To prevent damage to the gates, each comparator includes back-to-back zener diodes between input terminals. When differential voltage exceeds 6.2 V, the diodes turn on. Input resistors of 1 k $\Omega$  have been integrated to limit the current in this event.
- This device series incorporates ESD protection and is tested by the following methods:  
ESD Human Body Model tested per AEC-Q100-002 (JEDEC standard: JESD22-A114)  
ESD Machine Model tested per AEC-Q100-003 (JEDEC standard: JESD22-A115)  
Latch-up Current tested per JEDEC standard: JESD78.

## THERMAL INFORMATION (Note 5)

Thermal Metric	Symbol	Value	Unit
Junction-to-Ambient (Note 6)	$\theta_{JA}$	190	°C/W
Junction-to-Case Top	$\Psi_{JT}$	107	°C/W

- Short-circuits can cause excessive heating and destructive dissipation. Values are typical.
- Multilayer board, 1 oz. copper, 400 mm<sup>2</sup> copper area, both junctions heated equally
