FUSB302B

FUSB302B Programmable USB Type-C Controller w/PD

Description

The FUSB302B targets system designers looking to implement a DRP/SRC/SNK USB Type-C connector with low amount of programmability.

The FUSB302B enables the USB Type-C detection including attach, and orientation. The FUSB302B integrates the physical layer of the USB BMC power delivery protocol to allow up to 100 W of power and role swap. The BMC PD block enables full support for alternative interfaces of the Type-C specification.

Features

- Dual-role Functionality with Autonomous DRP Toggle
- Ability to Connect as Either a Host or a Device Based on What Has Been Attached
- Software Configurable Either as a Dedicated Host, Dedicated Device, or Dual Role
 - ◆ Dedicated Devices can Operate both on a Type-C Receptacle or a Type-C Plug with a Fixed CC and VCONN Channel
- Full Type-C 1.2 Support. Integrates the Following Functionality of the CC Pin:
 - ◆ Attach/Detach Detection as Host
 - ◆ Current Capability Indication as Host
 - ◆ Current Capability Detection as Device
 - ◆ Audio Adapter Accessory Mode
 - ◆ Debug Accessory Mode
 - ◆ Active Cable Detection
- Integrates CCx to VCONN Switch with Over-current Limiting for Powering USB3.1 Full Featured Cables
- USB Power Delivery (PD) 2.0, Version 1.2 Support:
 - ◆ Automatic GoodCRC Packet Response
 - ◆ Automatic Retries of Sending a Packet if a GoodCRC is Not Received
 - ◆ Automatic Soft Reset Packet Sent with Retries if Needed
 - ◆ Automatic Hard Reset Ordered Set Sent
- Dead Battery Support (SNK Mode Support when No Power Applied)
- Low Power Operation: $I_{CC} = 25 \mu A$ (Typical)
- AEC-Q100 Automotive Qualified Temperature Grade 2: ($-40^{\circ}C$ to $+105^{\circ}C$)
- Packaged in:
 - ◆ 9-ball WLCSP (1.215 mm \times 1.260 mm)
 - ◆ 14-lead MLP (2.5 mm \times 2.5 mm, 0.5 mm Pitch)

Applications

- Smartphones
- Tablets
- Laptops
- Notebooks
- Power Adapters
- Cameras
- Dongles
- Automotive

Table 3. PIN DESCRIPTION

Name	Type	Description
USB TYPE-C CONNECTOR INTERFACE		
CC1/CC2	I/O	Type-C connector Configuration Channel (CC) pins. Initially used to determine when an attach has occurred and what the orientation of the insertion is. Functionality after attach depends on mode of operation detected. Operating as a host: <ol style="list-style-type: none"> 1. Sets the allowable charging current for VBUS to be sensed by the attached device 2. Used to communicate with devices using USB BMC Power Delivery 3. Used to detect when a detach has occurred Operating as a device: <ol style="list-style-type: none"> 1. Indicates what the allowable sink current is from the attached host. Used to communicate with devices using USB BMC Power Delivery
GND	Ground	Ground
VBUS	Input	VBUS input pin for attach and detach detection when operating as an upstream facing port (Device). Expected to be an OVP protected input.
POWER INTERFACE		
VDD	Power	Input supply voltage.
VCONN	Power Switch	Regulated input to be switched to correct CC pin as VCONN to power USB3.1 full-featured cables and other accessories.
SIGNAL INTERFACE		
SCL	Input	I ² C serial clock signal to be connected to the phone-based I ² C master.
SDA	Open-Drain I/O	I ² C serial data signal to be connected to the phone-based I ² C master
INT_N	Open-Drain Output	Active LOW open drain interrupt output used to prompt the processor to read the I ² C register bits

FUSB302B

CONFIGURATION CHANNEL SWITCH

The FUSB302B integrates the control and detection functionality required to implement a USB Type-C host, device or dual-role port including:

- Device Port Pull-Down (R_D)
- Host Port Pull-Up (I_P)
- VCONN Power Switch with OCP for Full-Featured USB3.1 Cables

- USB BMC Power Delivery Physical Layer
- Configuration Channel (CC) Threshold Comparators

Each CC pin contains a flexible switch matrix that allows the host software to control what type of Type-C port is implemented. The switches are shown in Figure 6.

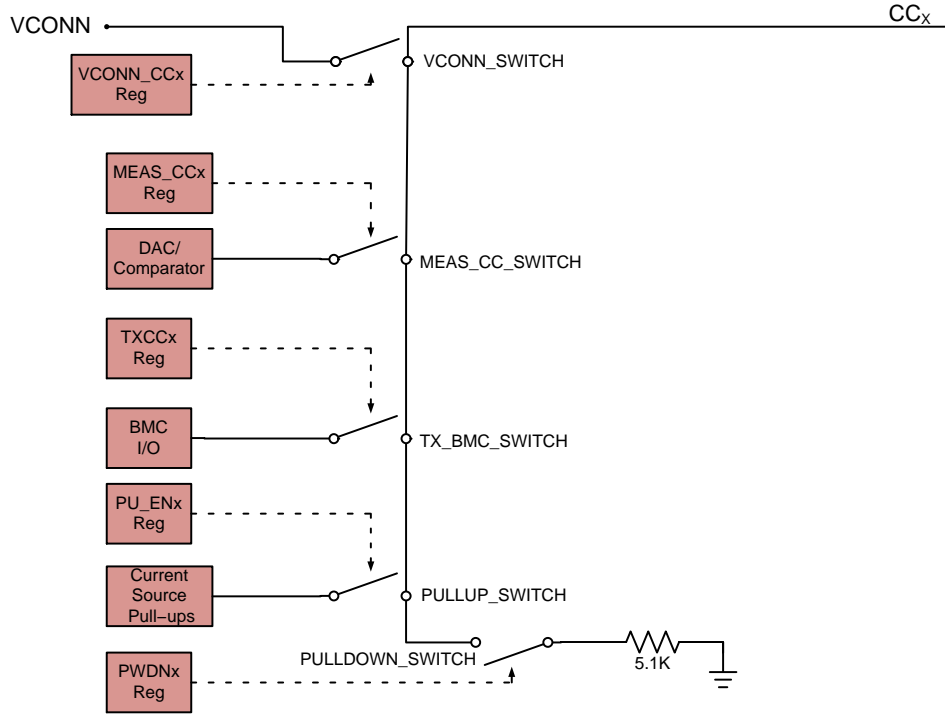

Figure 6. Configuration Channel Switch Functionality

TYPE-C DETECTION

The FUSB302B implements multiple comparators and a programmable DAC that can be used by software to determine the state of the CC and VBUS pins. This status information provides the processor all of the information required to determine attach, detach and charging current configuration of the Type-C port connection.

The FUSB302B has three fixed threshold comparators that match the USB Type-C specification for the three charging current levels that can be detected by a Type-C device. These comparators automatically cause BC_LVL and COMP interrupts to occur when there is a change of state. In addition to the fixed threshold comparators, the host software can use the 6-bit DAC to determine the state of the CC lines more accurately.

The FUSB302B also has a fixed comparator that monitors if VBUS has reached a valid threshold or not. The DAC can be used to measure VBUS up to 20 V which allows the software to confirm that changes to the VBUS line have occurred as expected based on PD or other communication methods to change the charging level.

Detection through Autonomous Device Toggle

The FUSB302B has the capability to do autonomous DRP toggle. In autonomous toggle the FUSB302B internally controls the PDWN1, PDWN2, PU_EN1 and PU_EN2, MEAS_CC1 and MEAS_CC2 and implements a fixed DRP toggle between presenting as a SRC and presenting as a SNK. Alternately, it can present as a SRC or SNK only and poll CC1 and CC2 continuously.

FUSB302B

Table 4. PROCESSOR CONFIGURES THE FUSB302B THROUGH I²C

I ² C Registers/Bits	Value
TOGGLE	1
PWR	07H
HOST_CUR0	1
HOST_CUR1	0
MEAS_VBUS	0
VCONN_CC1	0
VCONN_CC2	0
Mask Register	0xFE
Maska Register	0xBF
Maskb Register (Except I_TOGDONE and I_BC_LVL Interrupt)	0x01
PWR[3:0]	0xBF

1. Once it has been determined what the role is of the FUSB302B, it returns I_TOGDONE and TOGSS1/2.
2. Processor then can perform a final manual check through I²C.

Manual Device Toggle

The FUSB302B has the capability to do manual DRP toggle. In manual toggle the FUSB302B is configurable by the processor software by I²C and setting TOGGLE = 0.

Manual Device Detection and Configuration

A Type-C device must monitor VBUS to determine if it is attached or detached. The FUSB302B provides this information through the VBUSOK interrupt. After the Type-C device knows that a Type-C host has been attached, it needs to determine what type of termination is applied to each CC pin. The software determines if an Ra or Rd termination is present based on the BC_LVL and COMP interrupt and status bits.

Additionally, for Rd terminations, the software can further determine what charging current is allowed by the Type-C host by reading the BC_LVL status bits. This is summarized in Table 5.

Toggle Functionality

When TOGGLE bit (Control2 register) is set the FUSB302B implements a fixed DRP toggle between presenting as a SRC and as a SNK. It can also be configured to present as a SRC only or SNK only and poll CC1 and CC2 continuously. This operation is turned on with TOGGLE = 1 and the processor should initially write HOST_CUR1 = 0, HOST_CUR0 = 1 (for default current), VCONN_CC1 = VCONN_CC2 = 0, Mask Register = 0xFE, Maska register = 0xBF, and Maskb register = 0x01, and PWR = 0x01. The processor should also read the interrupt register to clear them prior to setting the TOGGLE bit.

Table 5. DEVICE INTERRUPT SUMMARY

Status Type	Interrupt Status				Meaning
	BC_LVL[1:0]	COMP	COMP Setting	VBUSOK	
CC Detection	2'b00	NA	NA	1	vRA
	2'b01	NA	NA	1	vRd-Connect and vRd-USB
	2'b10	NA	NA	1	vRd-Connect and vRd-1.5
	2'b11	0	6'b11_0100 (2.05 V)	1	vRd-Connect and vRd-3.0
Attach	NA	NA	NA	1	Host Attached, VBUS Valid
Detach	NA	NA	NA	0	Host Detached, VBUS Invalid

The high level software flow diagram for a Type-C device (SNK) is shown in Figure 7.

FUSB302B

Figure 7. SNK Software Flow

Manual Host Detection and Configuration

When the FUSB302B is configured as a Type-C host, the software can use the status of the comparators and DAC to determine when a Type-C device has been attached or detached and what termination type has been attached to each CC pin.

The FUSB302B allows the host software to change the charging current capabilities of the port through the

HOST_CUR control bits. If the HOST_CUR bits are changed prior to attach, the FUSB302B automatically indicates the programmed current capability when a device is attached. If the current capabilities are changed after a device is attached, the FUSB302B immediately changes the CC line to the programmed capability.

Figure 8. HOST_CUR Changed after Attach

FUSB302B

Figure 9. HOST_CUR Changed prior to Attach

The Type-C specification outlines different attach and detach thresholds for a Type-C host that are based on how much current is supplied to each CC pin. Based on the programmed HOST_CUR setting, the software adjusts the

DAC comparator threshold to match the Type-C specification requirements. The BC_LVL comparators can also be used as part of the Ra detection flow. This is summarized in Table 6.

Table 6. HOST INTERRUPT SUMMARY

Termination	HOST_CUR[1:0]	Interrupt Status			Attach/Detach
		BC_LVL[1:0]	COMP	COMP Setting	
Ra	2'b01	2'b00	NA	NA	NA
	2'b10	2'b01	0	6'b00_1010 (0.42 V)	
	2'b11	2'b10	0	6'b01_0011 (0.8 V)	
Rd	2'b01, 2'b10	NA	0	6'b10_0110 (1.6 V)	Attach
		NA	1	6'b10_0110 (1.6 V)	Detach
	2'b11	NA	0	6'b11_1110 (2.6 V)	Attach
		NA	1	6'b11_1110 (2.6 V)	Detach

The high level software flow diagram for a Type-C Host (SRC) is shown below in Figure 10.

FUSB302B

Figure 10. SRC Software Flow

Manual Dual-Role Detection and Configuration

The Type-C specification allows ports to be both a device and a host depending on what type of port has attached. This functionality is similar to USB OTG ports with the current USB connectors and is called a dual-role port. The

FUSB302B can be used to implement a dual-role port. A Type-C dual role port toggles between presenting as a Type-C device and a Type-C host. The host software controls the toggle time and configuration of the FUSB302B in each state as shown in Figure 11.

Figure 11. DRP Software Flow

FUSB302B

BMC POWER DELIVERY

The Type-C connector allows USB Power Delivery (PD) to be communicated over the connected CC pin between two ports. The communication method is the BMC Power Delivery protocol and is used for many different reasons with the Type-C connector. Possible uses are outlined below.

- Negotiating and controlling charging power levels
- Alternative Interfaces such as MHL, Display Port
- Vendor specific interfaces for use with custom docks or accessories
- Role swap for dual-role ports that want to switch who is the host or device
- Communication with USB3.1 full featured cables

The FUSB302B integrates a thin BMC PD client which includes the BMC physical layer and packet FIFOs (48 bytes for transmit and 80 bytes for receive) which allows packets to be sent and received by the host software through I²C accesses. The FUSB302B allows host software to implement all features of USB BMC PD through writes and

reads of the FIFO and control of the FUSB302B physical interface.

The FUSB302B uses tokens to control the transmission of BMC PD packets. These tokens are written to the transmit FIFO and control how the packet is transmitted on the CC pin. The tokens are designed to be flexible and support all aspects of the USB PD specification. The FUSB302B additionally enables control of the BMC transmitter through tokens. The transmitter can be enabled or disabled by specific token writes which allow faster packet processing by burst writing the FIFO with all the information required to transmit a packet.

The FUSB302B receiver stores the received data and the received CRC in the receive FIFO when a valid packet is received on the CC pin. The BMC receiver automatically enables the internal oscillator when an Activity is sensed on the CC pin and load to the FIFO when a packet is received. The I_ACTIVITY and I_CRC_CHK interrupts alert the host software that a valid packet was received.

Figure 12. USB BMC Power Delivery Blocks

Power Level Determination

The Type-C specification outlines the order of precedence for power level determination which covers power levels from basic USB2.0 levels to the highest levels of USB PD. The host software is expected to follow the USB Type-C specification for charging current priority based on feedback from the FUSB302B detection, external BC1.2 detection and any USB Power Delivery communication.

The FUSB302B does not integrate BC1.2 charger detection which is assumed available in the USB transceiver or USB charger in the system.

Power Up, Initialization and Reset

When power is first applied through VDD, the FUSB302B is reset and registers are initialized to the default values shown in the register map.

The FUSB302B can be reset through software by programming the SW_RES bit in the RESET register.

If no power applied to VDD then the SRC can recognize the FUSB302B as a SNK.

PD Automatic Receive GoodCRC

The power delivery packets require a GoodCRC acknowledge packet to be sent for each received packet where the calculated CRC is the correct value. This calculation is done by the FUSB302B and triggers the I_CRC_CHK interrupt if the CRC is good. If the AUTO_CRC (Switches1 register bit) is set and AUTO_PRE = 0, then the FUSB302B will automatically send the GoodCRC control packet in response to alleviate the local processor from responding quickly to the received packet. If GoodCRC is required for anything beyond SOP, then enable SOP*.

FUSB302B

PD Send

The FUSB302B implements part of the PD protocol layer for sending packets in an autonomous fashion.

Figure 13.

PD Automatic Sending Retries

If GoodCRC packet is not received and AUTO_RETRY is set, then a retry of the same message that was in the Tx FIFO written by the processor is executed within t_{Retry} and that is repeated for NRETRY times.

PD Send Soft Reset

If the correct GoodCRC packet is still not received for all retries then I_RETRYFAIL interrupt is triggered and if AUTO_SOFT_RESET is set, then a Soft Reset packet is created (MessageID is set to 0 and the processor upon servicing I_RETRYFAIL would set the true MessageIDCounter to 0.

If this Soft Reset is sent successfully where a GoodCRC control packet is received with a MessageID = 0 then I_TXSENT interrupt occurs.

If not, this Soft Reset packet is retried NRETRIES times (MessageID is always 0 for all retries) if a GoodCRC acknowledge packet is not received with CRCReceiveTimer expiring (t_{Receive} of 1.1 ms max). If all retries fail, then I_SOFTFAIL interrupt is triggered.

PD Send Hard Reset

If all retries of the soft reset packet fail and if AUTO_HARD_RESET is set, then a hard reset ordered set is sent by loading up the Tx FIFO with RESET1, RESET1, RESET1, RESET2 and sending a hard reset. Note only one

hard reset is sent since the typical retry mechanism doesn't apply. The processor's policy engine firmware is responsible for retrying the hard reset if it doesn't receive the required response.

Flush Rx-FIFO with BIST (Built-In Self Test) Test Data

During PD compliance testing, BIST test packets are used to test physical layer of the PD interface such as, frequency derivation, Amplitude measure and etc. The one BIST test data packet has 7 data objects (28byte data), header and CRC, but the message ID doesn't change, the packet should be ignored and not acted on by the PD policy engine. The PD protocol layer does need to send a GoodCRC message back after every packet. The BIST data can arrive continuously from a tester, which could cause the FUSB302B Rx FIFO to overflow and the PD protocol layer to stop sending GoodCRC messages unless the FIFO is read or cleared quickly. The FUSB302B has a special register bit in the I²C registers, bit[5] of address 0x09, that when the bit is set, all the data received next will be flushed from the Rx FIFO automatically and the PD protocol layer will keep sending GoodCRC messages back. Once BIST test is done, tester sends HardReset, so with the HardReset, processor has to write the bit back to disable. Also, if the bit can be de-selected anytime, then the coming packet has to be managed by protocol layer and policy engine.

I²C INTERFACE

The FUSB302B includes a full I²C slave controller. The I²C slave fully complies with the I²C specification version 6 requirements. This block is designed for Fast Mode Plus traffic up to 1 MHz SCL operation.

The TOGGLE features allow for very low power operation with slow clocking thus may not be fully

compliant to the 1 MHz operation. Examples of an I²C write and read sequence are shown in Figure 14 and Figure 15 respectively.

Note: Single Byte read is initiated by Master with P immediately following first data byte

Figure 14. I²C Write Example

FUSB302B

Note: If Register is not specified Master will begin read from current register. In this case only sequence showing in Red bracket is needed

S	From Master to Slave	S	Start Condition	NA	NOT Acknowledge (SDA High)	RD	Read =1
A	From Slave to Master	A	Acknowledge (SDA Low)	WR	Write=0	P	Stop Condition

Figure 15. I²C Read Example

Table 7. ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Min	Max	Unit
V _{VDD}	Supply Voltage from V _{DD}	-0.5	6.0	V
V _{CC_HDDR}	CC pins when configured as Host, Device or Dual Role Port	-0.5	6.0	V
V _{VBUS}	VBUS Supply Voltage	-0.5	28.0	V
T _{STORAGE}	Storage Temperature Range	-65	+150	°C
T _J	Maximum Junction Temperature	-	+150	°C
T _L	Lead Temperature (Soldering, 10 Seconds)	-	+260	°C
ESD	Human Body Model, ANSI/ESDA/JEDEC JS-001-2012	4	-	kV
	Charged Device Model, JEDEC JESD22-C101	1	-	

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

Table 8. RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Min	Typ	Max	Unit
V _{VBUS}	VBUS Supply Voltage	4.0	5.0	21.0	V
V _{VDD}	VDD Supply Voltage	2.7 (Note 3)	3.3	5.5	V
V _{VCONN}	VCONN Supply Voltage	2.7	-	5.5	V
I _{VCONN}	VCONN Supply Current	-	-	560	mA
T _A	Operating Temperature	-40	-	+85	°C
T _A	Operating Temperature (Note 11)	-40	-	+105	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

3. This is for functional operation only and not the lowest limit for all subsequent electrical specifications below. All electrical parameters have a minimum of 3.0 V operation.

I _{pd_stby_meas}	BMC PD Standby Current	3.0 to 5.5	Device Attached, BMC PD Active But Not Sending or Receiving Anything, PWR[3:0] = 7h	-	40	-	μA

Table 12. USB PD SPECIFIC PARAMETERS

Symbol	Parameter	T _A = -40 to +85°C T _A = -40 to +105°C (Note 11) T _J = -40 to +125°C			Unit
		Min	Typ	Max	
t _{HardReset}	If a Soft Reset message fails, a Hard Reset is sent after t _{HardReset} of CRCReceiveTimer expiring	-	-	5	ms
t _{HardReset Complete}	If the FUSB302B cannot send a Hard Reset within t _{HardResetComplete} time because of a busy line, then a I_HARDFAIL interrupt is triggered	-	-	5	ms
t _{Receive}	This is the value for which the CRCReceiveTimer expires. The CRCReceiveTimer is started upon the last bit of the EOP of the transmitted packet	0.9	-	1.1	ms
t _{Retry}	Once the CRCReceiveTimer expires, a retry packet has to be sent out within t _{Retry} time. This time is hard to separate externally from t _{Receive} since they both happen sequentially with no visible difference in the CC output	-	-	75	μs
t _{SoftReset}	If a GoodCRC packet is not received within t _{Receive} for NRETRIES then a Soft Reset packet is sent within t _{SoftReset} time.	-	-	5	ms
t _{Transmit}	From receiving a packet, we have to send a GoodCRC in response within t _{Transmit} time. It is measured from the last bit of the EOP of the received packet to the first bit sent of the preamble of the GoodCRC packet	-	-	195	μs

Table 13. IO SPECIFICATIONS

Symbol	Parameter	V _{DD} (V)	Conditions	T _A = -40 to +85°C T _A = -40 to +105°C (Note 11) T _J = -40 to +125°C			Unit

Table 21. SLICE

(Address: 05h; Reset Value: 0x0110_0000; Type: Read/Write)

Bit #	Name	R/W/C	Size (Bits)	Description
7:6	SDAC_HYS[1:0]	R/W	2	Adds hysteresis where there are now two thresholds, the <i>lower threshold which is always the value programmed by SDAC[5:0]</i> and the higher threshold that is: 11: 255 mV hysteresis: higher threshold = (SDAC value + 20hex) 10: 170 mV hysteresis: higher threshold = (SDAC value + Ahex) 01: 85 mV hysteresis: higher threshold = (SDAC value + 5) 00: No hysteresis: higher threshold = SDAC value
5:0	SDAC[5:0]	R/W	6	BMC Slicer DAC data input. Allows for a programmable threshold so as to meet the BMC receive mask under all noise conditions.

Table 22. CONTROL0

(Address: 06h; Reset Value: 0x0010_0100; Type: (see column below))

Bit #	Name	R/W/C	Size (Bits)	Description
7	Reserved	N/A	1	Do Not Use
6	TX_FLUSH	W/C	1	1: Self clearing bit to flush the content of the transmit FIFO
5	INT_MASK	R/W	1	1: Mask all interrupts 0: Interrupts to host are enabled
4	Reserved	N/A	1	Do Not Use
3:2	HOST_CUR[1:0]	R/W	2	1: Controls the host pull up current enabled by PU_EN[2:1]: 00: No current 01: 80 μ A – Default USB power 10: 180 μ A – Medium Current Mode: 1.5 A 11: 330 μ A – High Current Mode: 3 A
1	AUTO_PRE	R/W	1	1: Starts the transmitter automatically when a message with a good CRC is received. This allows the software to take as much as 300 μ S to respond after the I_CRC_CHK interrupt is received. Before starting the transmitter, an internal timer waits for approximately 170 μ S before executing the transmit start and preamble 0: Feature disabled
0	TX_START	W/C	1	1: Start transmitter using the data in the transmit FIFO. Preamble is started first. During the preamble period the transmit data can start to be written to the transmit FIFO. Self clearing.

Bit #	Name	R/W/C	Size (Bits)	Description
7:1	Reserved	N/A	6	Do Not Use
0	TOG_EXIT_AUD	R/W	1	1: In auto Rd only Toggle mode, stop Toggle at Audio accessory (Ra on both CC)

FUSB302B

Table 33. STATUS0A

(Address: 3Ch; Reset Value: 0x0000_0000; Type: Read)

Bit #	Name	R/W/C	Size (Bits)	Description
7:6	Reserved	N/A	2	Do Not Use
5	SOFTFAIL	R	1	1: All soft reset packets with retries have failed to get a GoodCRC acknowledge. This status is cleared when a START_TX, TXON or SEND_HARD_RESET is executed
4	RETRYFAIL	R	1	1: All packet retries have failed to get a GoodCRC acknowledge. This status is cleared when a START_TX, TXON or SEND_HARD_RESET is executed
3:2	POWER3:POWER2	R	2	Internal power state when logic internals needs to control the power state. POWER3 corresponds to PWR3 bit and POWER2 corresponds to PWR2 bit. The power state is the higher of both PWR[3:0] and {POWER3, POWER2, PWR[1:0]} so that if one is 03 and the other is F then the internal power state is F
1	SOFTRST	R	1	1: One of the packets received was a soft reset packet
0	HARDRST	R	1	1: Hard Reset PD ordered set has been received

Table 34. STATUS1A

(Address: 3Dh; Reset Value: 0x0000_0000; Type: Read)

Bit #	Name	R/W/C	Size (Bits)	Description
7:6	Reserved	N/A	2	Do Not Use
5:3	TOGSS3, TOGSS2, TOGSS1	R	3	000: Toggle logic running (processor has previously written TOGGLE=1) 001: Toggle functionality has settled to SRCon CC1 (STOP_SRC1 state) 010: Toggle functionality has settled to SRCon CC2 (STOP_SRC2 state) 101: Toggle functionality has settled to SNKOn CC1 (STOP_SNK1 state) 110: Toggle functionality has settled to SNKOn CC2 (STOP_SNK2 state) 111: Toggle functionality has detected AudioAccessory with vRa on both CC1 and CC2 (settles to STOP_SRC1 state) Otherwise: Not defined (do not interpret)
2	RXSOP2DB	R	1	1: Indicates the last packet placed in the RxFIFO is type SOP''_DEBUG (SOP double prime debug)
1	RXSOP1DB	R	1	1: Indicates the last packet placed in the RxFIFO is type SOP'_DEBUG (SOP prime debug)
0	RXSOP	R	1	1: Indicates the last packet placed in the RxFIFO is type SOP

FUSB302B

Table 35. INTERRUPTA

(Address: 3Eh; Reset Value: 0x0000_0000; Type: Read/Clear)

Bit #	Name	R/W/C	Size (Bits)	Description
7	I_OCP_TEMP	R/C	1	1: Interrupt from either a OCP event on one of the VCONN switches or an over-temperature event
6	I_TOGDONE	R/C	1	1: Interrupt indicating the TOGGLE functionality was terminated because a device was detected
5	I_SOFTFAIL	R/C	1	1: Interrupt from automatic soft reset packets with retries have failed
4	I_RETRYFAIL	R/C	1	1: Interrupt from automatic packet retries have failed
3	I_HARDSSENT	R/C	1	1: Interrupt from successfully sending a hard reset ordered set
2	I_TXSENT	R/C	1	1: Interrupt to alert that we sent a packet that was acknowledged with a GoodCRC response packet
1	I_SOFTTRST	R/C	1	1: Received a soft reset packet
0	I_HARDRST	R/C	1	1: Received a hard reset ordered set

Table 36. INTERRUPTB

(Address: 3Fh; Reset Value: 0x0000_0000; Type: Read/Clear)

Bit #	Name	R/W/C	Size (Bits)	Description
7	Reserved	N/A	6	Do Not Use
0	I_GCRSENT	R/C	1	1: Sent a GoodCRC acknowledge packet in response to an incoming packet that has the correct CRC value

FUSB302B

Table 37. STATUS0

(Address: 40h; Reset Value: 0x0000_0000; Type: Read)

Bit #	Name	R/W/C	Size (Bits)	Description
7	VBUSOK	R	1	1: Interrupt occurs when VBUS transitions through vVBUSthr. This bit typically is used to recognize port partner during startup
6	ACTIVITY	R	1	1: Transitions are detected on the active CC* line. This bit goes high after a minimum of 3 CC transitions, and goes low with no Transitions 0: Inactive
5	COMP	R	1	1: Measured CC* input is higher than reference level driven from the MDAC 0: Measured CC* input is lower than reference level driven from the MDAC
4	CRC_CHK	R	1	1: Indicates the last received packet had the correct CRC. This bit remains set until the SOP of the next packet 0: Packet received for an enabled SOP* and CRC for the enabled packet received was incorrect
3	ALERT	R	1	1: Alert software an error condition has occurred. An alert is caused by: TX_FULL: the transmit FIFO is full RX_FULL: the receive FIFO is full See Status1 bits
2	WAKE	R	1	1: Voltage on CC indicated a device attempting to attach 0: WAKE either not enabled (WAKE_EN=0) or no device attached
1:0	BC_LVL[1:0]	R	2	Current voltage status of the measured CC pin interpreted as host current levels as follows: 00: < 200 mV 01: > 200 mV, < 660 mV 10: > 660 mV, < 1.23 V 11: > 1.23 V Note the software must measure these at an appropriate time, while there is no signaling activity on the selected CC line. BC_LVL is only defined when Measure block is on which is when register bits PWR[2]=1 and either MEAS_CC1=1 or MEAS_CC2=1

Table 38. STATUS1

(Address: 41h; Reset Value: 0x0010_1000; Type: Read)

Bit #	Name	R/W/C	Size (Bits)	Description
7	RXSOP2	R	1	1: Indicates the last packet placed in the Rx FIFO is type SOP" (SOP double prime)
6	RXSOP1	R	1	1: Indicates the last packet placed in the Rx FIFO is type SOP' (SOP prime)
5	RX_EMPTY	R	1	1: The receive FIFO is empty
4	RX_FULL	R	1	1: The receive FIFO is full
3	TX_EMPTY	R	1	1: The transmit FIFO is empty
2	TX_FULL	R	1	1: The transmit FIFO is full
1	OVRTEMP	R	1	1: Temperature of the device is too high
0	OCP	R	1	1: Indicates an over-current or short condition has occurred on the VCONN switch

FUSB302B

Table 39. INTERRUPT

(Address: 42h; Reset Value: 0x0000_0000; Type: Read/Clear)

Bit #	Name	R/W/C	Size (Bits)	Description
7	I_VBUSOK	R/C	1	1: Interrupt occurs when VBUS transitions through 4.5 V. This bit typically is used to recognize port partner during startup
6	I_ACTIVITY	R/C	1	1: A change in the value of ACTIVITY of the CC bus has occurred
5	I_COMP_CHNG	R/C	1	1: A change in the value of COMP has occurred. Indicates selected CC line has tripped a threshold programmed into the MDAC
4	I_CRC_CHK	R/C	1	1: The value of CRC_CHK newly valid. I.e. The validity of the incoming packet has been checked
3	I_ALERT	R/C	1	1: Alert software an error condition has occurred. An alert is caused by: TX_FULL: the transmit FIFO is full RX_FULL: the receive FIFO is full See Status1 bits
2	I_WAKE	R/C	1	1: Voltage on CC indicated a device attempting to attach. Software must then power up the clock and receiver blocks
1	I_COLLISION	R/C	1	1: When a transmit was attempted, activity was detected on the active CC line. Transmit is not done. The packet is received normally
0	I_BC_LVL	R/C	1	1: A change in host requested current level has occurred

Table 40. FIFOS

(Address: 43h; Reset Value: 0x0000_0000; Type: (see column below))

Bit #	Name	R/W/C	Size (Bits)	Description
7:0	TX/RX Token	Read or Write	8	Writing to this register writes a byte into the transmit FIFO. Reading from this register reads from the receive FIFO. Each byte is a coded token. Or a token followed by a fixed number of packed data byte (see <i>token coding in Table 41</i>)

Software Model

Port software interacts with the port chip in two primary ways:

- I²C Registers
- 8 bit data tokens sent to or received from the FIFO register
- All reserved bits written in the TxFIFO should be 0 and all reserved bit read from the RxFIFO should be ignored

Transmit Data Tokens

Transmit data tokens provide in-sequence transmit control and data for the transmit logic. Note that the token codes, and their equivalent USB PD K-Code are not the same. Tokens are read one at a time when they reach the end of the TX FIFO. I.e., the specified token action is performed before the next token is read from the TX FIFO.

The tokens are defined as follows:

FUSB302B

Table 41. TOKENS USED IN FIFO

Code	Name	Size (Bytes)	Description
101x-xxx1 (0xA1)	TXON	1	Alternative method for starting the transmitter with the TX-START bit. This is not a token written to the TxFIFO but a command much like TX_START but it is more convenient to write it while writing to the TxFIFO in one contiguous write operation. It is preferred that the TxFIFO is first written with data and then TXON or TX_START is executed. It is expected that A1h will be written for TXON not any other bits where x is non-zero such as B1h, BFh, etc
0x12	SOP1	1	When reaching the end of the FIFO causes a Sync-1 symbol to be transmitted
0x13	SOP2	1	When reaching the end of the FIFO causes a Sync-2 symbol to be transmitted
0x1B	SOP3	1	When reaching the end of the FIFO causes a Sync-3 symbol to be transmitted
0x15	RESET1	1	When reaching the end of the FIFO causes a RST-1 symbol to be transmitted
0x16	RESET2	1	When reaching the end of the FIFO causes a RST-2 symbol to be transmitted
0x80	PACKSYM	1+N	This data token must be immediately followed by a sequence of N packed data bytes. This token is defined by the 3 MSB's being set to 3'b100. The 5 LSB's are the number of packed bytes being sent. Note: N cannot be less than 2 since the minimum control packet has a header that is 2 bytes and N cannot be greater than 30 since the maximum data packet has 30 bytes (2 byte header + 7 data objects each having 4 bytes) Packed data bytes have two 4 bit data fields. The 4 LSB's are sent first, after 4b5b conversion etc in the chip
0xFF	JAM_CRC	1	Causes the CRC, calculated by the hardware, to be inserted into the transmit stream when this token reaches the end of the TX FIFO
0x14	EOP	1	Causes an EOP symbol to be sent when this token reaches the end of the TX FIFO
0xFE	TXOFF	1	Turn off the transmit driver. Typically the next symbol after EOP

RECEIVE DATA TOKENS

Receive data tokens provide in-sequence receive control and data for the receive logic. The Rx FIFO can absorb as many packets as the number of bytes in the Rx FIFO (80 bytes). The tokens are defined as follows:

Table 42. TOKENS USED IN Rx FIFO

Code	Name	Size (Bytes)	Description
111b_bbbb	SOP	1	First byte of a received packet to indicate that the packet is an SOP packet ("b" is undefined and can be any bit)
110b_bbbb	SOP1	1	First byte of a received packet to indicate that the packet is an SOP' packet and occurs only if ENSOP1=1 ("b" is undefined and can be any bit)
101b_bbbb	SOP2	1	First byte of a received packet to indicate that the packet is an SOP" packet and occurs only if ENSOP2=1 ("b" is undefined and can be any bit)
100b_bbbb	SOP1DB	1	First byte of a received packet to indicate that the packet is an SOP' _DEBUG packet and occurs only if ENSOP1DB=1 ("b" is undefined and can be any bit)
011b_bbbb	SOP2DB	1	First byte of a received packet to indicate that the packet is an SOP" _DEBUG packet and occurs only if ENSOP2DB=1 ("b" is undefined and can be any bit)
010b_bbbb/ 001b_bbbb/ 000b_bbbb	Do Not Use	1	These can be used in future versions of this device and should not be relied on to be any special value. ("b" is undefined and can be any bit)
