

NCV308

Low Quiescent Current, Programmable Delay Time, Supervisory Circuit

The NCV308 series is one of the ON Semiconductor Supervisory circuit IC families. It is optimized to monitor system voltages from 0.405 V to 5.5 V, asserting an active low open-drain $\overline{\text{RESET}}$ output, together with Manual Reset ($\overline{\text{MR}}$) Input. The part comes with both fixed and externally adjustable versions.

Features

- Wide Supply Voltage Range 1.6 to 5.5 V
- Very Low Quiescent Current 1.6 μA
- Fixed Threshold Voltage Versions for Standard Voltage Rails Including 1.8 V, 3.3 V, 5.0 V
- Adjustable Version with Low Threshold Voltage 0.405 V (min)
- High Threshold Voltage Accuracy: 0.15% typ
- Support Manual Reset Input ($\overline{\text{MR}}$)
- Open-Drain $\overline{\text{RESET}}$ Output (Push-pull Output upon Request)
- Flexible Delay Time Programmability: 1.25 ms to 10 s
- Temperature Range: -40°C to $+125^{\circ}\text{C}$
- Small TSOP-6 Pb-Free Package
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Grade 1 Qualified and PPAP Capable
- These are Pb-Free Devices

Typical Applications

- DSP or Microcontroller Applications
- Notebook/Desktop Computers
- PDAs/Hand-Held Products
- Portable/Battery-Powered Products
- FPGA/ASIC Applications

ORDERING INFORMATION

See detailed ordering, marking and shipping information in the ordering information section on page 9 of this data sheet.

NCV308

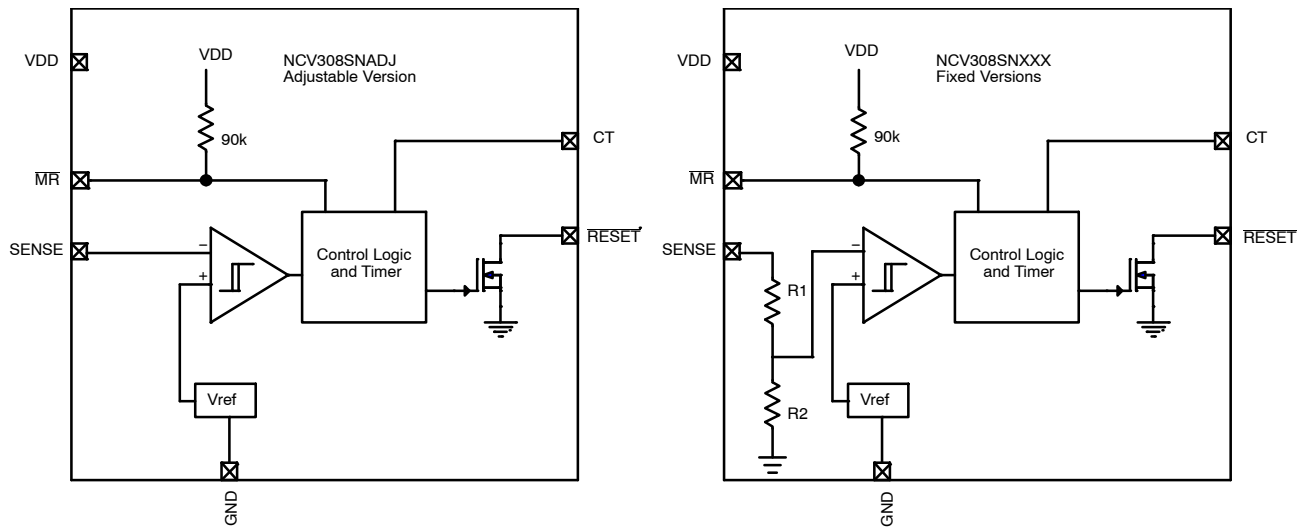

Figure 3. Functional Block Diagrams of Adjustable and Fixed Versions

Figure 4. Pin Connections Diagram (Top View)

Table 1. PIN OUT DESCRIPTION

Name	Pin Number	Description
VDD	6	Supply Voltage. A 0.1uF ceramic capacitor placed close to this pin is helpful for transient and parasitic.
SENSE	5	Sense Input, this is the voltage to be monitored. If the voltage at this terminal drops below the threshold voltage V_{IT} , then $\overline{\text{RESET}}$ is asserted. SENSE does not necessary monitor VDD, it can monitor any voltage lower than VDD.
CT	4	Reset Delay Time Setting Pin. Connecting this pin to VDD through a 40 k Ω to 200 k Ω resistor or leaving it open results in fixed reset delay times. Connecting this pin to a ground referenced capacitor (≥ 100 pF) gives a user-programmable reset delay time. See the <i>Setting Reset Delay Time</i> section for more information.
MR	3	Manual Reset input, $\overline{\text{MR}}$ low asserts $\overline{\text{RESET}}$. $\overline{\text{MR}}$ is internally tied to VDD by a 90 k Ω pull-up Resistor.
RESET	1	RESET Output, is an Active low open drain N-Channel MOSFET output, it is driven to a low impedance state when $\overline{\text{RESET}}$ is asserted (either the SENSE input is lower than the threshold voltage (V_{IT}) or the $\overline{\text{MR}}$ pin is set to a logic low). $\overline{\text{RESET}}$ will keep low (asserted) for the reset delay time after both SENSE is above V_{IT} and $\overline{\text{MR}}$ is set to a logic high. A pull-up resistor from 10k Ω to 1M Ω should be used on this pin. See Figure 5 for behavior of $\overline{\text{RESET}}$ depends on VDD, SENSE and MR conditions.
GND	2	Ground terminal. Should be connected to PCB ground reference

NCV308

Table 3. MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Input Voltage Range, V_{DD}	V_{DD}	-0.3 to + 6.0	V
CT Voltage Range V_{CT} , \overline{RESET} , \overline{MR} Current through CT pin	I_{CT}	-0.3 to $V_{DD} + 0.3 \leq 6.0$ 10	V mA
SENSE Pin Voltage		-0.3 to + 8.0	V
\overline{RESET} Pin Current		5	mA
Thermal Resistance Junction-to-Air TSOP-6	$R_{\theta JA}$	305	°C/W
Human Body Model (HBM) ESD Rating (Note 1)	ESD HBM	2000	V
Charged Device Model (CDM) ESD Rating (Note 1)	ESD CDM	1000	V
Latch up Current: (Note 2)	I_{LU}	± 100	mA
Storage Temperature Range	T_{STG}	-65 to + 150	°C
Maximum Junction Temperature	T_J	-40 to +150	°C
Moisture Sensitivity (Note 3)	MSL	Level 1	

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. This device series incorporates ESD protection and is tested by the following methods:

ESD Human Body Model tested per AEC-Q100-002 (JS-001-2017)

Field Induced Charge Device Model ESD characterization is not performed on plastic molded packages with body sizes smaller than 2 x 2 mm due to the inability of a small package body to acquire and retain enough charge to meet the minimum CDM discharge current waveform characteristic defined in JEDEC JS-002-2018

2. Latch up Current per JEDEC standard: JESD78 class II.

3. Moisture Sensitivity Level (MSL): 1 per IPC/JEDEC standard: J-STD-020A.

DETAILED DESCRIPTION

The NCV308 microprocessor supervisory product family is designed to assert a $\overline{\text{RESET}}$ signal when either the SENSE pin voltage drops below V_{IT} or the Manual Reset input ($\overline{\text{MR}}$) is driven low. The $\overline{\text{RESET}}$ output remains asserted for a programmable delay time after both $\overline{\text{MR}}$ and SENSE voltages return above the respective thresholds. A broad range of voltage threshold and reset delay time options are available, allowing NCV308 series to be used in a wide range of applications.

Reset threshold voltages can be factory-set from 1.67 V to 4.65 V while the NCV308SNADJ can be used for any voltage above 0.405 V using an external resistor divider.

Flexible delay time can be easily got with CT pin according to Table 5:

Table 5. DELAY TIME SETTING TABLE

CT pin Configuration	Delay Time (tD)
CT = VDD	300 ms (fixed)
CT = Open	20 ms (fixed)
Connecting a capacitor between pin CT and GND (Capacitor CT value > 100 pF)	1.25 ms ~ 10 s, depends on capacitor value (Refer to the Setting Reset Delay Time Section)

Output

The $\overline{\text{RESET}}$ output is typically connected to the $\overline{\text{RESET}}$ control pin of a microprocessor. For Open-Drain output versions, a pull-up resistor must be used to hold this line high when $\overline{\text{RESET}}$ is not asserted. The $\overline{\text{RESET}}$ output is active once V_{DD} is over $V_{DD}(\text{min})$, this voltage is much lower than most microprocessors' functional voltage range. $\overline{\text{RESET}}$ remains high as long as SENSE is above its threshold (V_{IT}) and the Manual Reset input ($\overline{\text{MR}}$) is logic high. If either SENSE falls below V_{IT} or $\overline{\text{MR}}$ is driven low, $\overline{\text{RESET}}$ is asserted.

Once $\overline{\text{MR}}$ is again logic high and SENSE is above ($V_{IT} + V_{HYS}$), the $\overline{\text{RESET}}$ pin goes to a high impedance state after delay time (tD). The open-drain structure of $\overline{\text{RESET}}$ is capable to allow the reset signal for the microprocessor to have a voltage higher than V_{DD} (up to 5.5 V). The pull-up resistor should be no smaller than 10 k Ω as a result of the finite impedance of the $\overline{\text{RESET}}$ line.

SENSE Input

The SENSE input should be connected to the monitored voltage directly. If the voltage on this pin drops below V_{IT} , then $\overline{\text{RESET}}$ is asserted. The comparator has a built-in hysteresis to prevent erratic reset operation. It is good practice to put a 1 nF to 10 nF bypass capacitor on the SENSE input to reduce its sensitivity to transients and layout parasitic.

The NCV308SNADJ can be used to monitor any voltage rail down to 0.405 V by the circuit shown in Figure 12. The new V_{IT}' can be derived from resistor divider network of R1 and R2 by:

$$V_{IT}' = \left(\frac{R1}{R2} + 1 \right) \times V_{IT} \quad (\text{eq. 1})$$

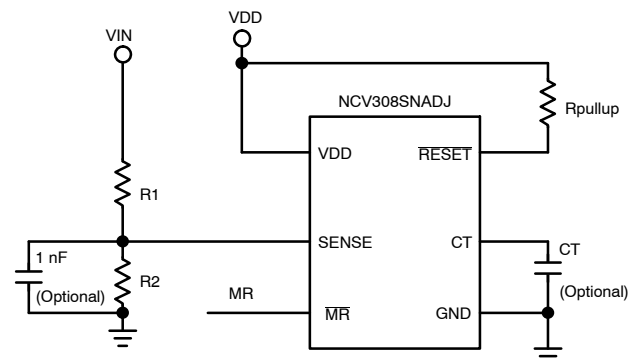

Figure 12. Using NCV308SNADJ to Monitor a User-Defined Threshold Voltage

Manual Reset Input ($\overline{\text{MR}}$)

The Manual Reset input ($\overline{\text{MR}}$) allows a processor or other logic circuits to initiate a reset. A logic low on $\overline{\text{MR}}$ causes $\overline{\text{RESET}}$ to assert. After $\overline{\text{MR}}$ returns to a logic high and SENSE is above its reset threshold, $\overline{\text{RESET}}$ is de-asserted after the delay time set by CT pin. $\overline{\text{MR}}$ is internally tied to V_{DD} by a 90 k Ω resistor so this pin can be left unconnected if $\overline{\text{MR}}$ will not be used.

Figure 13 shows how $\overline{\text{MR}}$ can be used to monitor multiple system voltages (e.g. I/O supply voltage of some DSP/processors should be setup before core voltage, and DSP/processor can only start after both I/O and core voltages setup).

NCV308

Figure 13. Using \overline{MR} to Monitor Multiple System Voltages

Setting Reset Delay Time

The NCV308 has three options for setting the reset delay time as shown in Table 5. Figure 14 shows the configuration for a fixed 300 ms typical delay time by tying CT to V_{DD}; a resistor from 40 kΩ to 200 kΩ must be used. Figure 15 shows a fixed 20 ms delay time by leaving the CT pin unconnected.

Figure 16 shows a user-defined program time between 1.25 ms and 10 s by connecting a capacitor between CT pin and ground.

Figure 14. Delay Time Fixed to 300 ms when CT Connected to V_{DD} by Resistor

Figure 15. Delay Time Fixed to 20 ms when CT is Open

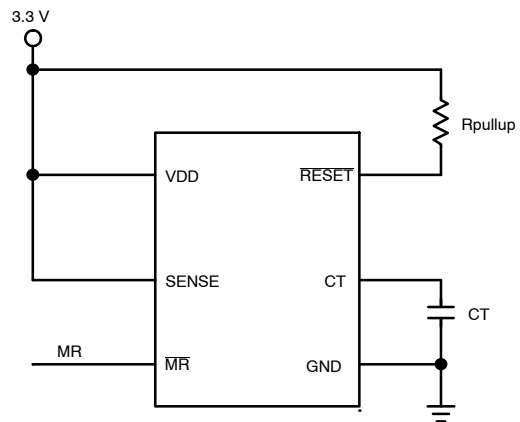

Figure 16. Delay Time Set by Capacitor

The capacitor CT should be ≥ 100 pF for NCV308 to recognize that the capacitor is present. The capacitor value for a given delay time can be calculated using the following equation:

$$CT(\text{nF}) = (tD(\text{s}) - 0.5 \times 10^{-3}(\text{s})) \times 175 \quad (\text{eq. 2})$$

NCV308

Parasitic capacitances of CT pin should be considered to avoid reset delay time deviation or error.

Immunity to Sense Pin Voltage Transients

NCV308 is relatively immune to short negative transients on SENSE pin. Sensitivity to transients is dependent on threshold overdrive, as shown in the Maximum Transient Duration at Sense vs. Sense Threshold Overdrive Voltage graph (Figure 9) in Typical Operating Characteristics section.

Hints

If better EMC performance is needed, add small external capacitors as close to the pins as possible according to Figure 17 and Table 6:

Figure 17. External Capacitor Placement Example

Table 6. RECOMMENDED CAPACITOR VALUES

Device Pins	Recommended Capacitor
VDD connected to SENSE	10 nF
RESET	47 nF
MR	47 nF
