High-Speed USB 2.0 (480 Mbps) DPDT Switches

ON Semiconductor's NLAS7222B and NLAS7222C are part of a series of analog switch circuits that are produced using the company's advanced sub−micron CMOS technology, achieving industry−leading performance.

Both the NLAS7222B and NLAS7222C are 2− to 1−port analog switches. Their wide bandwidth and low bit−to−bit skew allow them to pass high−speed differential signals with good signal integrity. Each switch is bidirectional and offers little or no attenuation of the high−speed signals at the outputs. Industry−leading advantages include a propagation delay of less than 250 ps, resulting from its low channel resistance and low I/O capacitance. Their high channel−to−channel crosstalk rejection results in minimal noise interference. Their bandwidth is wide enough to pass High−Speed USB 2.0 differential signals (480 Mb/s).

Features

- R_{ON} is Typically 8.0 Ω at V_{CC} = 3.3 V
- Low Crosstalk: −30 dB @ 250 MHz
- Low Current Consumption: 1.0 μA
- Channel On−Capacitance: 8.0 pF (Typical)
- V_{CC} Operating Range: 1.65 V to 4.5 V
- > 700 MHz Bandwidth (or Data Frequency)
- These are Pb−Free Devices

Typical Applications

- Differential Signal Data Routing
- USB 2.0 Signal Routing

Important Information

- Continuous Current Rating Through Each Switch ±300 mA
- 8 kV I/O to GND ESD Protection

Channel switch control/s test socket is normalized. Off isolation is measured across an off channel. On loss is the bandwidth of an On switch. V_{ISO}, Bandwidth and V_{ONL} are independent of the input signal direction.

V_{ISO} = Off Channel Isolation = $20 \, \text{Log} \left(\dfrac{V_{OUT}}{V_{IN}} \right)$ for V_{IN} at 100 kHz

V_{ONL} = On Channel Loss = $20 \, \text{Log} \left(\dfrac{V_{OUT}}{V_{IN}} \right)$ for V_{IN} at 100 kHz to 50 MHz

Bandwidth (BW) = the frequency 3 dB below V_{ONL}
V_{CT} = Use V_{ISO} setup and test to all other switch analog input/outputs terminated with 50 Ω

APPLICATIONS INFORMATION

The low on resistance and capacitance of the NLAS7222B provides for a high bandwidth analog switch suitable for applications such as USB data switching. Results for the USB 2.0 signal quality tests will be shown in this section, along with a description of the evaluation test board. The data for the eye diagram signal quality and jitter tests verifies that the NLAS7222B can be used as a data switch in low, full and high speed USB 2.0 systems.

Figures 8, 9 and 10 provide a description of the test evaluation board. The USB tests were conducted per the procedures provided by the USB Implementers Forum (www.usb.org), the industry group responsible for defining the USB certification requirements. The test patterns were generated by a PC and MATLAB software, and were inputted to the analog switch through USB connectors J1 (HSD1) or J2 (HSD2). A USB certified device was plugged into connector J4 to function as a data transceiver. The high speed and full speed tests used a flash memory device, while the low speed tests used a mouse. Test connectors J3 and J5 provide a direct connection of the USB device and were used to verify that the analog switch does not distort the data signals.
