

NB3L208K

2.5V, 3.3V Differential 1:8 HCSL Fanout Buffer

Description

The NB3L208K is a differential 1:8 Clock fanout buffer with High-speed Current Steering Logic (HCSL) outputs. Inputs can directly accept differential LVPECL, LVDS, and HCSL signals. Single-ended LVPECL, HCSL, LVCMOS, or LVTTL levels are accepted with a proper external V_{th} reference supply per Figures 4 and 6. The input signal will be translated to HCSL and provides eight identical copies operating up to 350 MHz.

The NB3L208K is optimized for ultra-low phase noise, propagation delay variation and low output-to-output skew, and is DB800H compliant. As such, system designers can take advantage of the NB3L208K's performance to distribute low skew clocks across the backplane or the motherboard making it ideal for Clock and Data distribution applications such as PCI Express, FBDIMM, Networking, Mobile Computing, Gigabit Ethernet, etc.

Output drive current is set by connecting a 475 Ω resistor from IREF (Pin 27) to GND per Figure 11. Outputs can also interface to LVDS receivers when terminated per Figure 12.

Features

- Maximum Input Clock Frequency > 350 MHz
- 2.5 V 5% / 3.3 V 10% Supply Voltage Operation
- 8 HCSL Outputs
- DB800H Compliant
- PCIe Gen 3, Gen 4 Compliant
- Individual OE Control Pin for Each Bank of 2 Outputs
- 100 ps Max Output-to-Output Skew Performance
- 1 ns Typical Propagation Delay
- 500 ps Typical Rise and Fall Times
- 80 fs Maximum Additive RMS Phase Jitter
- 40 C to +85 C Ambient Operating Temperature
- QFN 32-pin Package, 5 mm x 5 mm
- These Devices are Pb-Free and are RoHS Compliant

Typical Applications

- PCI Express
- FBDIMM
- Mobile Computing
- Networking
- Gigabit Ethernet

Table 1. PIN DESCRIPTION

| Pin Number | Pin Name | I/O | Description |
|------------|-------------|---------|---|
| 1 | DIF_0 | O, DIF | 0.7 V Differential True Output |
| 2 | DIF_0# | O, DIF | 0.7 V Differential Complementary Output |
| 3 | DIF_1 | O, DIF | 0.7 V Differential True Output |
| 4 | DIF_1# | O, DIF | 0.7 V Differential Complementary Output |
| 5 | DIF_2 | O, DIF | 0.7 V Differential True Output |
| 6 | DIF_2# | O, DIF | 0.7 V Differential Complementary Output |
| 7 | DIF_3 | O, DIF | 0.7 V Differential True Output |
| 8 | DIF_3# | O, DIF | 0.7 V Differential Complementary Output |
| 9 | VDD_O | Power | Power supply for outputs |
| 10 | OE#[7:6] | I, SE | LVTTTL / LVCMOS active low input for enabling output pair DIF_6/6# & DIF_7/7#. 0 enables outputs, 1 disables outputs. Internal pull down. |
| 11 | CLK_IN | I, DIF | Differential True input |
| 12 | CLK_IN# | I, DIF | Differential Complementary input |
| 13 | GND | Power | Ground |
| 14 | VDD | Power | Core power supply |
| 15 | GND_O | Power | Ground for outputs |
| 16 | VDD_O | O, DIF | Power supply for outputs |
| 17 | DIF_7# | O, DIF | 0.7 V Differential Complementary Output |
| 18 | DIF_7 | O, DIF | 0.7 V Differential True Output |
| 19 | DIF_6# | O, DIF | 0.7 V Differential Complementary Output |
| 20 | DIF_6 | O, DIF | 0.7 V Differential True Output |
| 21 | DIF_5# | O, DIF | 0.7 V Differential Complementary Output |
| 22 | DIF_5 | O, DIF | 0.7 V Differential True Output |
| 23 | DIF_4# | O, DIF | 0.7 V Differential Complementary Output |
| 24 | DIF_4 | O, DIF | 0.7 V Differential True Output |
| 25 | VDD_O | Power | Power supply for outputs |
| 26 | GND_O | Power | Ground for outputs |
| 27 | IREF | I | A precision resistor is attached to this pin to set the differential output current. Use $R_{REF} = 475 \Omega$, 1% for 100 Ω trace, with 50 Ω termination. Use $R_{REF} = 412 \Omega$, 1% for 85 Ω trace, with 43 Ω termination. |
| 28 | OE#[1:0] | I, SE | LVTTTL / LVCMOS active low input for enabling output pair DIF_0/0# & DIF_1/1#. 0 enables outputs, 1 disables outputs. Internal pull down. |
| 29 | OE#[3:2] | I, SE | LVTTTL / LVCMOS active low input for enabling output pair DIF_2/2# & DIF_3/3#. 0 enables outputs, 1 disables outputs. Internal pull down. |
| 30 | OE#[5:4] | I, SE | LVTTTL / LVCMOS active low input for enabling output pair DIF_4/4# & DIF_5/5#. 0 enables outputs, 1 disables outputs. Internal pull down. |
| 31 | GND_O | Power | Ground for outputs |
| 32 | VDD_O | Power | Power supply for outputs |
| EP | Exposed Pad | Thermal | The Exposed Pad (EP) on the QFN-32 package bottom is thermally connected to the die for improved heat transfer out of package. The exposed pad must be attached to a heat-sinking conduit. The pad is electrically connected to the die, and must be electrically and thermally connected to GND on the PC board. |

NB3L208K

Table 2. ATTRIBUTES

| Characteristics | | Value |
|--|------------------------|----------------------|
| ESD Protection | Human Body Model | > 2000 V |
| RPD – Pull-down Resistor | | 50 kΩ |
| Moisture Sensitivity (Note 1) | QFN-32 | Level 1 |
| Flammability Rating | Oxygen Index: 28 to 34 | UL 94 V-0 @ 0.125 in |
| Transistor Count | | 1344 |
| Meets or exceeds JEDEC Spec EIA/JESD78 IC Latchup Test | | |

1. For additional information, see Application Note AND8003/D.

Table 3. ABSOLUTE MAXIMUM RATINGS

| Symbol | Parameter | | Min | Max | Unit |
|-------------------|---|--------------------|------|-------------|------|
| V _{DD} | Core Supply Voltage | | - | 4.6 | V |
| V _{DD_O} | I/O Supply Voltage | | - | 4.6 | V |
| V _{IH} | Input High Voltage (Note 2) | | - | 4.6 | V |
| V _{IL} | Input Low Voltage | | -0.5 | - | V |
| I _{OUT} | Maximum Output Current | | - | 24 | mA |
| T _A | Operating Temperature Range | | | -40 to +85 | C |
| T _{stg} | Storage Temperature Range | | | -65 to +150 | C |
| θ _{JA} | Thermal Resistance (Junction-to-Ambient) (Note 3) | 0 lfpm 500 lfpm | | 31 27 | C/W |
| θ _{JC} | Thermal Resistance (Junction-to-Case) (Note 3) | | | 12 | C/W |
| T _{sol} | Wave Solder | | | 265 | C |

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

2. Maximum V_{IH} is not to exceed maximum V_{DD}.

3. JEDEC standard multilayer board – 2S2P (2 signal, 2 power) with 8 filled thermal vias under exposed pad.

NB3L208K

Table 4. DC CHARACTERISTICS $V_{DD} = V_{DD_O} = 3.3\text{ V}$ 10% or 2.5 V 5%, $T_A = -40\text{ C}$ to 85 C

| Symbol | Characteristics | Min | Typ | Max | Unit |
|--------|-----------------|-----|-----|-----|------|
|--------|-----------------|-----|-----|-----|------|

POWER SUPPLY CURRENT

| | | | | | |
|------------------------|--|----------------|------------|----------------|----|
| V_{DD} | Core Power Supply Voltage $V_{DD} = 3.3\text{ V}$ 10% $V_{DD} = 2.5\text{ V}$ 5% | 2.970 2.375 | 3.3 2.5 | 3.630 2.625 | V |
| V_{DD_O} | Output Power Supply Voltage $V_{DD_O} = 3.3\text{ V}$ 10% $V_{DD_O} = 2.5\text{ V}$ 5% | 2.970 2.375 | 3.3 2.5 | 3.630 2.625 | V |
| $I_{DD} + I_{DD_O}$ | Total Power Supply Current (all outputs active @ 350 MHz, $R_{REF} = 412\ \Omega$, $R_L = 43\ \Omega$) | | 170 | 210 | mA |
| I_{stdby} | Standby Current, all OE pins de-asserted with inputs @ 350 MHz | | 50 | 65 | mA |
| I_{incr} | Incremental output current for additional pair of outputs; One OE Enabled | | 30 | 45 | mA |
| $I_{stdby} + I_{incr}$ | Standby Current plus incremental current for one additional pair of differential outputs; One OE Enabled @ 350 MHz | | 80 | 110 | mA |

HCSL OUTPUTS (Notes 4, 5)

| | | | | | |
|-----------|--|------------|-------------|-----|----|
| V_{OH} | Output HIGH Voltage | 660 | | 850 | mV |
| V_{OL} | Output LOW Voltage | -150 | | | mV |
| V_{OUT} | Output Swing (Single-Ended) Output Swing (Differential) | 400 800 | 750 1500 | | mV |

DIFFERENTIAL INPUT DRIVEN SINGLE-ENDED (Note 6) (Figures 4 and 6)

| | | | | | |
|-----------|--|------|--|----------------|---|
| V_{IH} | CLK_IN/CLK_IN# Single-ended Input HIGH Voltage | 0.5 | | V_{DD} | V |
| V_{IL} | CLK_IN/CLK_IN# Single-ended Input LOW Voltage | GND | | $V_{IH} - 0.3$ | V |
| V_{th} | Input Threshold Reference Voltage Range (Note 7) | 0.25 | | $V_{DD} - 1.0$ | V |
| V_{ISE} | Single-ended Input Voltage ($V_{IH} - V_{IL}$) | 0.5 | | V_{DD} | V |

DIFFERENTIAL INPUTS DRIVEN DIFFERENTIALLY (Note 8) (Figures 5 and 7)

| | | | | | |
|-------------|--|------|--|------------------|---------------|
| V_{IHD} | Differential Input HIGH Voltage | 0.5 | | $V_{DD} - 0.85$ | V |
| V_{ILD} | Differential Input LOW Voltage | 0 | | $V_{IHD} - 0.25$ | V |
| V_{ID} | Differential Input Voltage ($V_{IHD} - V_{ILD}$) | 0.25 | | 1.3 | V |
| V_{IHCMR} | Input Common Mode Range (Differential Configuration) (Note 9) (Figure 8) | 0.5 | | $V_{DD} - 0.85$ | V |
| I_{IL} | Input Leakage Current $0 < V_{IN} < V_{DD}$ (Note 10) | -5 | | 5 | μA |

LVTTTL / LVCMOS INPUTS (OE#_x)

| | | | | | |
|----------|---|------|--|----------------|---------------|
| V_{IH} | Input HIGH Voltage | 2.0 | | $V_{DD} + 0.3$ | V |
| V_{IL} | Input LOW Voltage | -0.3 | | 0.8 | V |
| I_{IL} | Input LOW Current ($V_{IN} = \text{GND}$) | -10 | | +10 | μA |
| I_{IH} | Input HIGH Current ($V_{IN} = V_{DD}$) | | | 100 | μA |

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

- Test configuration is $R_S = 33.2\ \Omega$, $R_L = 49.9$, $C_L = 2\ \text{pF}$, $R_{REF} = 475\ \Omega$.
- Measurement taken from Single-Ended waveform unless specified otherwise.
- V_{IH} , V_{IL} , V_{th} and V_{ISE} parameters must be complied with simultaneously.
- V_{th} is applied to the complementary input when operating in single-ended mode.
- V_{IHD} , V_{ILD} , V_{ID} and V_{CMR} parameters must be complied with simultaneously.
- The common mode voltage is defined as V_{IH} .
- Does not include inputs with pulldown resistors.

NB3L208K

Table 5. AC TIMING CHARACTERISTICS $V_{DD} = V_{DD_O} = 3.3\text{ V}$ 10% or 2.5 V 5%, $T_A = -40\text{ C}$ to 85 C (Note 15)

| Symbol | Characteristics | Min | Typ | Max | Unit |
|-----------------------------------|--|------|------|------------------|--------|
| F_{max} | Maximum Input Frequency | 350 | | | MHz |
| T_{rise}/T_{fall} | Rise Time / Fall Time (Notes 13, 17 and 33) (Figure 13) | 175 | 500 | 700 | ps |
| Output Slew Rate | Output Slew Rate (Notes 13 and 17) | 0.5 | | 2.0 | V/ns |
| $\Delta T_{rise}/\Delta T_{fall}$ | Rise/Fall Time Variation (Notes 17 and 26) | | | 125 | ps |
| Slew Rate Matching | (Notes 18, 27 and 28) | | | 20% | |
| V_{high} | Voltage High (Notes 17, and 20) (Figure 14) | 660 | 700 | 850 | mV |
| V_{low} | Voltage Low (Notes 17, and 21) (Figure 14) | -150 | 0 | +150 | mV |
| Input Slew Rate | (Note 29 and 32) | 0.35 | | | V/ns |
| V_{cross} absolute | Absolute Crossing Point Voltages (Notes 12, 17 and 24) Relative Crossing Point Voltages can be calculated (Notes 16, 17 and 24) (Figure 16) | 250 | | 550 | mV |
| Total ΔV_{cross} | Total Variation of Vcross Over All Edges (Notes 17 and 25) | | | 140 | mV |
| Duty Cycle | (Note 18) (Figure 15) | 45 | | 55 | % |
| V_{ovs} | Maximum Voltage (Overshoot) (Notes 17 and 22) (Figure 14) | | | $V_{high} + 0.3$ | V |
| V_{uds} | Maximum Voltage (Undershoot) (Notes 17 and 23) (Figure 14) | | | $V_{low} - 0.3$ | V |
| V_{rb} | Ringback Voltage (Note 17) (Figure 14) | 0.2 | | N/A | V |
| T_{oe_lat} | OE Latency (Note 11) | 4 | 6 | 12 | Cycles |
| t_{pd} | Input-to-Output Delay CLK_IN, DIF_[7:0] (Note 31) | 0.6 | 1.0 | 1.4 | ns |
| t_{SKEW} | Output-to-Output Skew across all 8 outputs DIF_[7:0] (Notes 30 and 31) | 0 | 30 | 100 | ps |
| $T_{SKEW(0-0)}$ | Output-to-Output Skew between 2 output pairs controlled by the same OE DIF_[7:0] (Notes 30 and 31) | 0 | 5 | 20 | ps |
| $t_{JITTER\phi}$ | Additive RMS Phase Jitter $f_{carrier} = 156.25\text{ MHz}$, 12 kHz – 20 MHz Integrated Range (Figure 3) | | 46 | 80 | fs |
| t_{pClEG3} | Additive RMS Phase Jitter PCIe Gen 3 (PLL BW= 2–4 MHz or 2–5 MHz, CDR = 10 MHz) (Notes 34 and 35) | | 0.07 | 0.4 | ps |
| t_{pClEG4} | Additive RMS Phase Jitter PCIe Gen 4 (PLL BW= 2–4 MHz or 2–5 MHz, CDR = 10 MHz) (Notes 34 and 35) | | 0.07 | 0.4 | ps |

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

11. Time from deassertion until outputs are >200 mV.

12. Measured at crossing point where the instantaneous voltage value of the rising edge of CLK equals the falling edge of CLK#.

13. Measured from $V_{OL} = 0.175\text{ V}$ to $V_{OH} = 0.525\text{ V}$. Only valid for Rising Clock and Falling Clock#.

14. This measurement refers to the total variation from the lowest crossing point to the highest, regardless of which edge is crossing

15. Test configuration is $R_S = 33.2\ \Omega$, $R_P = 49.9$, $C_L = 2\text{ pF}$, $R_{REF} = 475\ \Omega$.

16. Vcross(rel) Min and Max are derived using the following, Vcross(rel) Min = $0.250 + 0.5 (V_{high\ avg} - 0.700)$. Vcross(rel) Max = $0.550 - 0.5 (0.700 - V_{high\ avg})$. (see Figure 16 for further clarification).

17. Measurement taken from Single Ended waveform.

18. Measurement taken from differential waveform.

19. Unless otherwise noted, all specifications in this table apply to all frequencies.

20. V_{high} is defined as the statistical average High value as obtained by using the Oscilloscope V_{high} Math function.

21. V_{low} is defined as the statistical average Low value as obtained by using the Oscilloscope V_{low} Math function.

22. Overshoot is defined as the absolute value of the maximum voltage.

23. Undershoot is defined as the absolute value of the minimum voltage.

24. The crossing point must meet the absolute and relative crossing point specifications simultaneously.

25. ΔV_{cross} is defined as the total variation of all crossing voltages of Rising CLOCK and Falling CLOCK#. This is the maximum allowed variance in Vcross for any particular system.

26. Measured with oscilloscope, averaging off, using min max statistics. Variation is the delta between min and max.

27. Matching applies to rising edge rate for clock and falling edge rate for Clock#. It is measured using a 75 mV window centered on the average crosspoint where clock rising meets Clock# falling. The median crosspoint is used to calculate the voltage threshold the oscilloscope is to use for the edge rate calculations.

28. Slew Rate matching is derived using the following, $2 * (T_{rise} - T_{fall}) / (T_{rise} + T_{fall})$.

29. Input slew rate is based on single ended measurement. This is the minimum input slew rate at which the NB3L208K devices are guaranteed to meet all performance specifications.

30. Measured into fixed 2 pF load cap. Input to output skew is measured at the first output edge following the corresponding input.

31. Measured from differential cross-point to differential cross-point with scope averaging on to find mean value.

32. The differential input clock is expected to be sourced from a high performance clock oscillator.

33. Measured at 3.3 V 10% with typical HCSL input levels.

34. See <http://www.pcisig.com> for complete specs

35. For RMS figures, additive jitter is calculated by solving the following equation: $(\text{Additive jitter})^2 = (\text{total jitter})^2 - (\text{input jitter})^2$

NB3L208K

Figure 3. Typical Phase Noise Plot at $f_{\text{carrier}} = 156.25$ MHz at an Operating Voltage of 3.3 V, Room Temperature

The above phase noise data was captured using Agilent E5052A/B. The data displays the input phase noise and output phase noise used to calculate the additive phase jitter at a specified integration range. The additive RMS phase jitter contributed by the device (integrated between 12 kHz and 20 MHz) is 45.7 fs.

The additive RMS phase jitter performance of the fanout buffer is highly dependent on the phase noise of the input source.

To obtain the most accurate additive phase noise measurement, it is vital that the source phase noise be notably lower than that of the DUT. If the phase noise of the source is similar or greater than the device under test output, the source noise will dominate the additive phase jitter calculation and lead to an artificially low result for the additive phase noise measurement within the integration range.

$$\text{Additive RMS phase jitter} = \sqrt{\text{RMS phase jitter of output}^2 - \text{RMS phase jitter of input}^2}$$

$$45.7 \text{ fs} = \sqrt{73.7 \text{ fs}^2 - 57.8 \text{ fs}^2}$$

NB3L208K

Figure 15. Differential (CLOCK – CLOCK#) Measurement Points (Tperiod, Duty Cycle)

Figure 16. V_{cross} Range Clarification (Note 36)

36. The picture above illustrates the effect of V_{high} above and below 700 mV on the V_{cross} range. The purpose of this is to prevent a 250 mV V_{cross} with an 850 mV V_{high} . In addition, this prevents the case of a 550 mV V_{cross} with a 660 mV V_{high} . The actual specification for V_{cross} is dependent upon the measured amplitude of V_{high} .

NB3L208K

Signal and Feature Operation

Table 6. OE# FUNCTIONALITY (Notes 37, 38 and 39)

| CLK_IN / CLK_IN# | OE# (Pin) | DIF | DIF # | Notes |
|------------------|-----------|---------|---------|-------|
| Running | 1 | Low | Low | 37 |
| Running | 0 | Running | Running | |
| Not Running | x | x | x | |

37. The outputs are tri-stated, but the termination networks pull them low

38. OE# pins are asynchronous asserted-low signals.

39. Each OE# pin controls two pair of DIF outputs.

OE# Assertion (Transition from '1' to '0')

All differential outputs that were tri-stated (low due to termination pull down) will resume normal operation in a glitch free manner. The latency from the assertion to active outputs is 4 – 12 DIF clock periods.

Note: Input clock must remain running for a minimum of 12 clock cycles.

OE# De-Assertion (Transition from '0' to '1')

The maximum latency from the de-assertion to tristated (low due to termination pull down) outputs is 12 DIF clock periods.

Table 7. NB3L208K RESISTIVE LUMPED TEST LOADS FOR DIFFERENTIAL CLOCKS

| Board Target Trace/Term Z | Reference R, I _{ref} = VDD/(3*R _{REF}) | Output Current | V _{OH} @ Z | R _s | R _p |
|---|---|--|---------------------|----------------|----------------|
| 100 Ω Differential 50 Ω Single-Ended | R _{REF} = 475 Ω 1%, I _{REF} = 2.32 mA | I _{OH} = 6 * I _{REF} | 0.7 V @ 50 | 33 Ω 5% | 50 Ω 5% |
| 85 Ω Differential 43 Ω Single-Ended | R _{REF} = 412 Ω, 1%, I _{REF} = 2.67 mA | I _{OH} = 6 * I _{REF} | 0.7V @ 43.2 | 27 Ω 5% | 43 Ω 5% |

Buyer is responsible for its products and applications using **onsemi** products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by **onsemi**. "Typical" parameters which may be provided in **onsemi** data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. **onsemi** does not convey any license under any of its intellectual property rights nor the rights of others. **onsemi** products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use **onsemi** products for any such unintended or unauthorized application, Buyer shall indemnify and hold **onsemi** and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that **onsemi** was negligent regarding the design or manufacture of the part. **onsemi** is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
