Analog Multiplexers/ Demultiplexers with Injection Current Effect Control with LSTTL Compatible Inputs

Automotive Customized

MC74HCT4851A, MC74HCT4852A

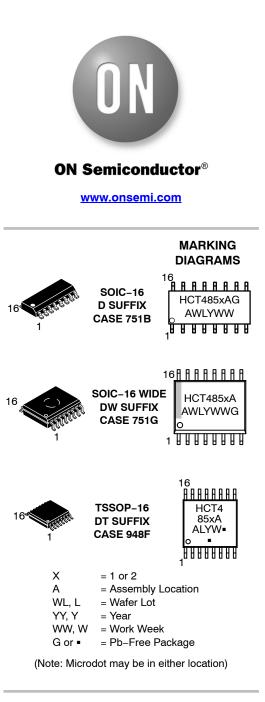

This device is pin compatible to standard HC405x and MC1405xB analog mux/demux devices, but feature injection current effect control. This makes them especially suited for usage in automotive applications where voltages in excess of normal logic voltage are common.

The injection current effect control allows signals at disabled analog input channels to exceed the supply voltage range without affecting the signal of the enabled analog channel. This eliminates the need for external diode/ resistor networks typically used to keep the analog channel signals within the supply voltage range.

The devices utilize low power silicon gate CMOS technology. The Channel Select and Enable inputs are compatible with standard CMOS or LSTTL outputs.

Features

- Injection Current Cross–Coupling Less than 1mV/mA (See Figure 6)
- Pin Compatible to HC405x and MC1405xB Devices
- Power Supply Range (V_{CC} GND) = 4.5 to 5.5 V
- In Compliance With the Requirements of JEDEC Standard No. 7 A
- Chip Complexity: 154 FETs or 36 Equivalent Gates
- NLV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These Devices are Pb-Free and are RoHS Compliant

MAXIMUM RATINGS

Symbol	Parameter		Value	Unit
V _{CC}	Positive DC Supply Voltage	(Referenced to GND)	-0.5 to + 7.0	V
V _{in}	DC Input Voltage (Any Pin)	(Referenced to GND)	-0.5 to V _{CC} + 0.5	V
I	DC Current, Into or Out of Any Pin		±25	mA
PD	Power Dissipation in Still Air,	SOIC Package† TSSOP Package†	500 450	mW
T _{stg}	Storage Temperature Range		–65 to + 150	°C
ΤL	Lead Temperature, 1 mm from (SOI	Case for 10 Seconds C or TSSOP Package	260	°C

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, V_{in} and V_{out} should be constrained to the range GND $\leq (V_{in} \text{ or } V_{out}) \leq V_{CC}$.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V_{CC}). Unused outputs must be left open.

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Min	Max	Unit	
V _{CC}	Positive DC Supply Voltage (Refer	enced to GND)	4.5	5.5	V
V _{in}	DC Input Voltage (Any Pin) (Refer	enced to GND)	GND	V _{CC}	V
V _{IO} *	Static or Dynamic Voltage Across Swi	0.0	1.2	V	
T _A	Operating Temperature Range, All Package Types		- 55	+ 125	°C
t _r , t _f	Input Rise/Fall Time (Channel Select or Enable Inputs)	$V_{CC} = 2.0 V$ $V_{CC} = 4.5 V$ $V_{CC} = 6.0 V$	0 0 0	1000 500 400	ns

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

*For voltage drops across switch greater than 1.2 V (switch on), excessive V_{CC} current may be drawn; i.e., the current out of the switch may contain both V_{CC} and switch input components. The reliability of the device will be unaffected unless the Maximum Ratings are exceeded.
