ORDERING INFORMATION

See detailed ordering and shipping information page 12 of this data sheet.

Description

The NB3F8L3010C is a 3:1:10 Clock / Data fanout buffer operating on a 3.3 V / 2.5 V Core V_{DD} and two flexible 3.3 V / 2.5 V / 1.8 V / 1.5 V $VDDO_n$ supplies which must be equal or less than V_{DD}.

A Mux selects between a Crystal input, or either of two differential/SE Clock / Data inputs. Differential Inputs accept LVPECL, LVDS, HCSL, or SSTL and Single−Ended levels. The MUX control lines, SEL0 and SEL1, select CLK0/$\overline{\text{CLK0}}$, CLK1/$\overline{\text{CLK1}}$, or Crystal input pins per Table 3. The Crystal input is disabled when a Clock input is selected. Output enable pin, OE, synchronously forces a High Impedance state (HZ) when Low per Table 4.

Outputs consist of 10 single−ended LVCMOS outputs.

Features

- Ten CMOS / LVTTL Outputs up to 200 MHz
- Differential Inputs Accept LVPECL, LVDS, HCSL, or SSTL
- Crystal Oscillator Interface
- Crystal Input Frequency Range: 10 MHz to 50 MHz
- Output Skew: 10 ps Typical
- Additive RMS Phase Jitter @ 125 MHz, (12 kHz – 20 MHz): 0.03 ps (Typical)
- Synchronous Output Enable
- Output Defined Level When Input is Floating
- Power Supply Modes:
  - Single 3.3 V
  - Single 2.5 V
  - Mixed 3.3 V ± 5% Core/2.5 V ± 5% Output Operating Supply
  - Mixed 3.3 V ± 5% Core/1.8 V ± 0.2 V Output Operating Supply
  - Mixed 3.3 V ± 5% Core/1.5 V ± 0.15 V Output Operating Supply
  - Mixed 2.5 V ± 5% Core/ 1.8 V ± 0.2 V Output Operating Supply
  - Mixed 2.5 V ± 5% Core /1.5 V ± 0.15 V Output Operating Supply
- Two Separate Output Bank Power Supplies
- Industrial temp. range -40°C to 85°C
- These are Pb−Free Devices

Applications

- Clock Distribution
- Networking and Communications
- High End Computing
- Wireless and Wired Infrastructure

End Products

- Servers
- Ethernet Switch/Routers
- ATE
- Test and Measurement

Table 1. PIN DESCRIPTION

Number	Name	Type	Input Default	Description
1, 3, 5, 7, 8	Q0, Q1, Q2, Q3, Q4	LVCMOS		Outputs – Bank A
17, 18, 20, 22, 24	Q5, Q6, Q7, Q8, Q9	LVCMOS		Outputs – Bank B
2, 6	VDDOA	Power		Positive Supply Pins for Bank A Outputs Q0 – Q4
19, 23	VDDOB	Power		Positive Supply Pins for Bank B Outputs Q5 – Q9
4, 9, 15, 16, 21, 25, 26, 32	GND	GND		Ground Supply
10	VDD	Power		V_{DD} Positive Supply pin for Core and Inputs.
11	XTAL_IN	XTAL OSC / CLK Input		Crystal Oscillator Interface or External Clock Source at LVCMOS Levels
12	XTAL_OUT	XTAL OSC Output		Crystal Oscillator Interface
13	CLK0	Diff / SE Input	Pulldown	Non-inverting clock/data input 0.
14	$\overline{\text{CLK0}}$	Diff / SE Input	Pullup / Pulldown	Inverting differential clock input 0.
27	$\overline{\text{CLK1}}$	Diff / SE Input	Pullup / Pulldown	Inverting differential clock input 1
28	CLK1	Diff / SE Input	Pulldown	Non-inverting clock/data input 1
29	SEL1	LVCMOS / LVTTL Input	Pulldown	Input clock select. See Table 3 for function. Input Pulldown
30	SEL0	LVCMOS / LVTTL Input	Pulldown	Input clock select. See Table 3 for function. Input Pulldown
31	OE	LVCMOS / LVTTL Input	Pulldown	Output Enable Control. See Table 4 for function.
–	EP	–		The Exposed Pad (EP) on the QFN−32 package bottom is thermally connected to the die for improved heat transfer out of package. The exposed pad must be attached to a heat−sinking conduit. The pad is electrically connected to the die, and must be electrically connected to GND.

1. All VDD, $VDDO_n$ and GND pins must be externally connected to a power supply to guarantee proper operation. Bypass each V_{DD} and $VDDO_n$ with 0.01 μF CAP to GND.

Table 2. PIN CHARACTERISTICS

Symbol	Parameter	Min	Typ	Max	Unit
C_{IN}	Input Capacitance		4		pF
R	Input Pulldown Resistor; Input Pulldown Resistor		50		kΩ

Moisture Sensitivity (Note 2)	QFN32	Level 1
Flammability Rating	Oxygen Index: 28 to 34	UL 94 V−0 @ 0.125 in
Transistor Count		474 Devices
Meets or exceeds JEDEC Spec EIA/JESD78 IC Latchup Test		

2. For additional information, see Application Note AND8003/D.

Table 8. MAXIMUM RATINGS (Note 3)

Symbol	Parameter	Condition	Rating	Unit
V_{DD}, $VDDO_n$	Positive Power Supply	GND = 0 V	4.6	V
V_I	Input Voltage XTAL_IN Diff, SELx, OE Inputs		 $0 \le V_I \le V_{DD}$ $-0.5 \le V_I \le V_{DD} + 0.5$	V
V_O	Output Voltage		$-0.5 \le V_O \le VDDO_n + 0.5$	V
T_A	Operating Temperature Range, Industrial		−40 to +85	°C
T_{stg}	Storage Temperature Range		−65 to +150	°C
θ_{JA}	Thermal Resistance (Junction−to−Ambient)	0 lfpm 500 lfpm	31 27	°C/W
θ_{JC}	Thermal Resistance (Junction−to−Case)	(Note 3)	12	°C/W

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

3. JEDEC standard multilayer board − 2S2P (2 signal, 2 power).

Table 9. POWER SUPPLY DC CHARACTERISTICS V_{DD} = 3.3 V ± 5% (3.135 V to 3.465 V) or V_{DD} = 2.5 V ±5% (2.375 V to 2.625 V) and $VDDO_n$ = 3.3 V ± 5% (3.135 V to 3.465 V) or 2.5 V ± 5% (2.375 V to 2.625 V) or 1.8 V ± 0.2 V (1.6 V to 2.0 V) or 1.5 V ± 0.15 V (1.35 V to 1.65 V); T_A = −40°C to 85°C

Symbol	Parameter	Test Conditions	Min	Typ	Max	Unit
IDD	VDD Power Supply Current	OE = 0, no load 3.3 V ± 5%; $VDDO_n$ = 3.3 V ± 5% or 2.5 V ± 5% or 1.8 V ± 0.2 V or 1.5 V ± 0.15 V 2.5 V ± 5%; $VDDO_n$ = 2.5 V ± 5% or 1.8 V ± 0.2 V or 1.5 V ± 0.15 V		30	50	mA
IDDO	VDDO Power Supply Current	OE = 0, no load 3.3 V ± 5%; $VDDO_n$ = 3.3 V ± 5% or 2.5 V ± 5% or 1.8 V ± 0.2 V or 1.5 V ± 0.15 V 2.5 V ± 5%; $VDDO_n$ = 2.5 V ± 5% or 1.8 V ± 0.2 V or 1.5 V ± 0.15 V			5	mA

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm.

Table 10. DC CHARACTERISTICS T_A = −40°C to 85°C

Symbol	Parameter	Test Conditions	Min	Typ	Max	Unit
V_{IH}	LVCMOS / LVTTL Input High Voltage (OE, SELx)	V_{DD} = 3.3 V ±5% V_{DD} = 2.5 V ± 5%	2 1.7		V_{DD} + 0.3 V_{DD} + 0.3	V
V_{IL}	LVCMOS / LVTTL Input Low Voltage (OE, SELx)	V_{DD} = 3.3 V ±5% V_{DD} = 2.5 V ± 5%	−0.3 −0.3		0.8 0.7	V
I_{IH}	Input High Current OE, SELx, CLKx/$\overline{CLKx}$	 V_{DD} = V_{IN} = 3.465 V V_{DD} = V_{IN} = 3.465 V or 2.625 V			 150 150	µA
I_{IL}	Input Low Current OE, SELx CLKx $\overline{CLKx}$	 V_{DD} = 3.465 V; V_{IN} = 0.0 V V_{DD} = 3.465 V or 2.625 V V_{IN} = 0.0 V V_{DD} = 3.465 V or 2.625 V V_{IN} = 0.0 V	 −5 −5 −150			µA
V_{OH}	Output High Voltage (Note 4)	$VDDO_n$ = 3.3 V ± 5%	2.6			V
		$VDDO_n$ = 2.5 V ± 5%	1.8			
		$VDDO_n$ = 1.8 V ± 0.2 V	1.2			
		$VDDO_n$ = 1.5 V ± 0.15 V	0.9			
V_{OL}	Output Low Voltage (Note 4)	$VDDO_n$ = 3.3 V ± 5% or 2.5 V ± 5%			0.5	V
		$VDDO_n$ = 1.8 V ± 0.2 V			0.4	
		$VDDO_n$ = 1.5 V ± 0.15 V			0.37	
V_{PP}	Peak−to−Peak Input Voltage V_{IL} > −0.3 V CLKx/$\overline{CLKx}$	V_{DD} = 3.3 V ±5% or V_{DD} = 2.5 V ± 5%	0.15		1.3	V
V_{IHCMR}	Input High Level Common Mode Range V_{CM} = V_{IH}; V_{IL} > −0.3 V CLKx/$\overline{CLKx}$	V_{DD} = 3.3 V ±5% or V_{DD} = 2.5 V ± 5%	0.5		V_{DD} − 0.85	V

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm.

APPLICATION INFORMATION

Recommendations for Unused LVCMOS Output Pins

Inputs:

CLK/$\overline{\text{CLK}}$ Inputs

For applications not requiring the use of the differential input, both CLK and $\overline{\text{CLK}}$ can be left floating. Though not required, but for additional protection, a 1 kΩ resistor can be tied from CLK to ground.

Crystal Inputs

For applications not requiring the use of the crystal oscillator input, both XTAL_IN and XTAL_OUT can be left floating. Though not required, but for additional protection, a 1 kΩ resistor can be tied from XTAL_IN to ground.

LVCMOS Outputs

A 33 Ω series terminating resistor may be used on each clock output if the trace is longer than 1 inch.

LVCMOS Control Pins

All control pins have internal pulldowns; additional resistance is not required but can be added for additional protection. A 1 kΩ resistor can be used.

Power Supplies

VDD is the power supply for the core and input circuitry.

VDDOA and **VDDOB** are two separate positive power supplies for two banks of outputs:

VDDOA pins 2 and 6 are connected internally for outputs Q0 – Q4.

VDDOB pins 19 and 23 are connected internally for outputs Q5 – Q9.

Differential Input with Single−Ended Interconnect

Refer to Figure 5 to interconnect a single−ended to a Differential Pair of inputs. The reference bias voltage V_{REF} = V_{DD}/2 is generated by the resistor divider of R3 and R4. Bypass capacitor (C1) can filter noise on the DC bias. This bias circuit should be located as close to the input pin as possible. Adjust R1 and R2 to common mode voltage of the signal input swing to preserve duty cycle.

This configuration requires that the sum of the output impedance of the driver (Ro) and the series resistance (Rs) equals the transmission line impedance. In addition, matched termination by R1 and R2 will attenuate the signal amplitude in half. Termination may be done by using Rs or by using R1 and R2. First, Rs = 0 and then R3 and R4 in parallel should equal the transmission line impedance. For most 50 Ω applications, R1 and R2 can be 100 Ω. The differential input can handle full rail LVCMOS signaling, but it is recommended that the amplitude be reduced. The datasheet specifies a differential amplitude which needs to be doubled for a single ended equivalent stimulus. V_{ILmin} cannot be less than −0.3 V and V_{IHmax} cannot be more than V_{DD} + 0.3 V. The datasheet specifications are characterized and guaranteed by using a differential signal.

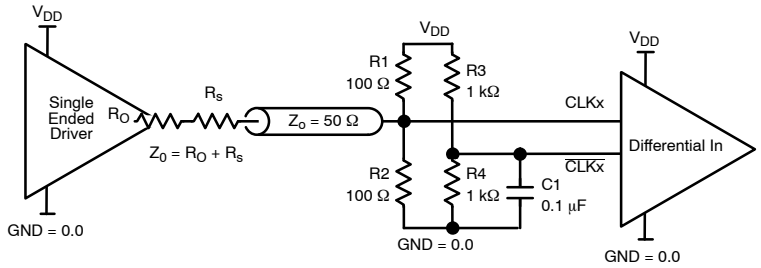

Figure 5. Differential Input with Single−ended Interconnect

Crystal Input Interface

The device has been characterized with 18 pF parallel resonant crystals. The capacitor values, C1 and C2, shown in Figure 6 below as 15 pF were determined using an 18 pF parallel resonant crystal and were chosen to minimize the ppm error. The optimum C1 and C2 values can be slightly adjusted for different board layouts.

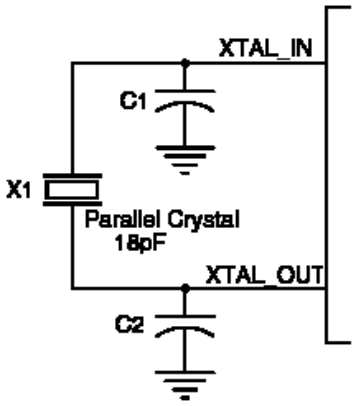

Figure 6. Crystal Input Interface

CLOCK Overdriving the XTAL Interface

The XTAL_IN input can accept a single−ended LVCMOS signal through an AC coupling capacitor. A general LVCMOS interface diagram is shown in Figure 7 and a general LVPECL interface in Figure 8. The XTAL_OUT pin must be left floating. The maximum amplitude of the input signal should not exceed 2 V and the input edge rate can be as slow as 10 ns. This configuration requires that the output impedance of the driver (Ro) plus the series resistance (Rs) equals the transmission line impedance. In addition, matched termination at the crystal input will attenuate the signal in half. This can be done in one of two ways. First, R1 and R2 in parallel should equal the transmission line impedance. For most 50 Ω applications, R1 and R2 can be 100 Ω. This can also be accomplished by removing R1 and making R2 50 Ω. By overdriving the crystal oscillator, the device will be functional, but note, the device performance is guaranteed by using a quartz crystal.

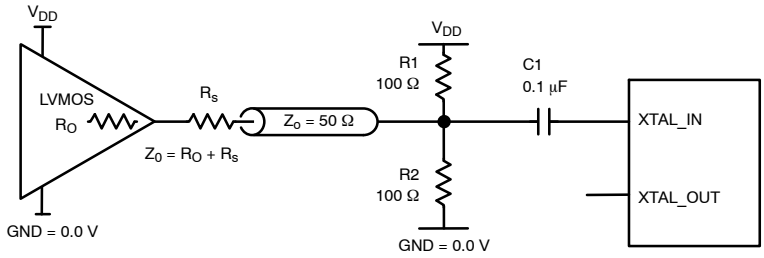

Figure 7. General Diagram for LVCMOS Driver to XTAL Input Interface Use Rs or R1 / R2

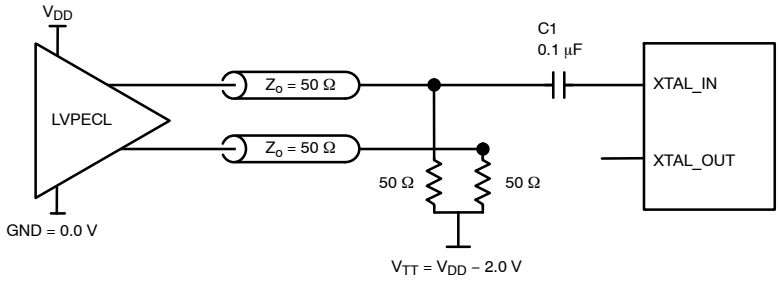

Figure 8. General Diagram for LVPECL Driver to XTAL Input Interface

Differential Clock Input Interface

The CLK / $\overline{CLK}$ accept LVDS, LVPECL, SSTL, HCSL differential signals. Signals must meet the V_{PP} and VCMR input requirements. Figures 9 to 13 show interface examples for the CLK / $\overline{CLK}$ input with built−in 50 Ω terminations driven by the most common driver types. The input interfaces suggested here are examples only. If the driver is from another vendor, use their termination recommendation. Please consult with the vendor of the driver component to confirm the driver termination requirements.

VFQFN EPAD Thermal Release Path

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in Figure 14. The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts. While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as “heat pipes”. The number of vias (i.e. “heat pipes”) is application specific and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13 mils (0.30 to 0.33 mm) with 1 oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only.
