# **Phase-Frequency Detector**

## MCH12140, MCK12140

#### Description

The MCH/K12140 is a phase frequency-detector intended for phase-locked loop applications which require a minimum amount of phase and frequency difference at lock. When used in conjunction with high performance VCO such as the MC100EL1648, a high bandwidth PLL can be realized. The device is functionally compatible with the MC12040 phase-frequency detector with the maximum frequency extending to 800 MHz.

When the Reference (R) and VCO (V) inputs are unequal in frequency and/or phase, the differential UP (U) and DOWN (D) outputs will provide pulse streams which when subtracted and integrated provide an error voltage for control of a VCO. See AND8040 for further information. The device is packaged in a small outline, surface mount 8–lead SOIC package. There are two versions of the device to provide I/O compatibility to the two existing ECL standards. The MCH12140 is compatible with MECL<sup>TM</sup> 10H logic levels while the MCK12140 is compatible to 100 K ECL logic levels. This device can also be used in +5.0 V systems. See AND8020 for termination information

### Features

- 800 MHz Typical Bandwidth
- Small Outline 8-Lead SOIC Package
- 75 k $\Omega$  Internal Input Pulldown Resistors
- >1000 V ESD Protection
- These Devices are Pb–Free, Halogen Free and are RoHS Compliant

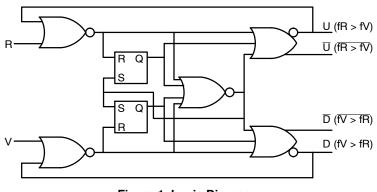

Figure 1. Logic Diagram

For proper operation, the input edge rate of the R and V inputs should be less than 5.0 ns.

#### Table 4. MAXIMUM RATINGS

Symbol	Rating		Value	Unit
V <sub>EE</sub>	Power Supply (V <sub>CC</sub> = 0 V)		-8.0 to 0	VDC
VI	Input Voltage (V <sub>CC</sub> = 0 V)		0 to -6.0	VDC
l <sub>out</sub>	Output Current Cor	itinuous Surge	50 100	mA
T <sub>A</sub>	Operating Temperature Range		-40 to +70	°C
V <sub>EE</sub>	Operating Range (Note 3)		-5.7 to -4.2	V

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

NOTE: ESD data available upon request.

- 10H circuits are designed to meet the DC specifications shown in the table after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse airflow greater than 500 lfpm is maintained. Outputs are terminated through a 50 Ω resistor to -2.0 V except where otherwise specified on the individual data sheets.
- This table replaces the three tables traditionally seen in ECL 100 K data books. The same DC parameter values at V<sub>EE</sub> = -4.5 V now apply across the full V<sub>EE</sub> range of -4.2 V to -5.5 V. Outputs are terminated through a 50 Ω resistor to -2.0 V except where otherwise specified on the individual data sheets.
- 3. Parametric values specified at: H-Series: -4.20 V to -5.50 V
  - K-Series: -4.94 V to -5.50 V

#### Table 5. DC CHARACTERISTICS (V<sub>EE</sub> = V<sub>EE</sub>(min) - V<sub>EE</sub>(max); V<sub>CC</sub> = GND, unless otherwise noted.)

			–40°C 0°C		0°C	25°C

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm.

#### **APPLICATIONS INFORMATION**

The 12140 is a high speed digital circuit used as a phase comparator in an analog phase-locked loop. The device determines the "lead" or "lag" phase relationship and time difference between the leading edges of a VCO (V) signal and a Reference (R) input. Since these edges occur only once per cycle, the detector has a range of  $\pm 2\pi$  radians.

The operation of the 12140 can best be described using the plots of Figure 2. Figure 2 plots the average value of  $\overline{U}$ ,  $\overline{D}$  and the difference between  $\overline{U}$  and  $\overline{D}$  versus the phase difference between the V and R inputs.

There are four potential relationships between V and R: R lags or leads V and the frequency of R is less than or greater than the frequency of V. Under these four conditions the 12140 will function as follows:

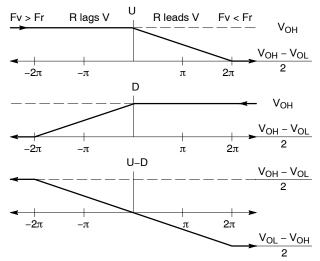

Figure 2. Average Output Voltage vs. Phase Difference

#### R lags V in phase

When the R and V inputs are equal in frequency and the phase of R lags that of V the  $\overline{U}$  output will stay HIGH while the  $\overline{D}$  output will pulse from HIGH to LOW. The magnitude of the pulse will be proportional to the phase difference between the V and R inputs reaching a minimum 50% duty cycle under a 180° out of phase condition. The signal on  $\overline{D}$  indicates to the VCO to decrease in frequency to bring the loop into lock.

#### V frequency > R frequency

When the frequency of V is greater than that of R the 12140 behaves in a similar fashion as above. Again the signal on  $\overline{D}$  indicates that the VCO frequency must be decreased to bring the loop into lock.

#### R leads V in phase

When the R and V inputs are equal in frequency and the phase of R leads that of V the  $\overline{D}$  output will stay HIGH while the  $\overline{U}$  output pulses from HIGH to LOW. The magnitude of the pulse will be proportional to the phase difference between the V and R inputs reaching a minimum 50% duty cycle under a 180° out of phase condition. The signal on  $\overline{U}$  indicates to the VCO to increase in frequency to bring the loop into lock.

#### V frequency < R frequency

When the frequency of V is less than that of R the 12140 behaves in a similar fashion as above. Again the signal on  $\overline{U}$  indicates that the VCO frequency must be decreased to bring the loop into lock.

From Figure 2 when V and R are at the same frequency and in phase the value of  $\overline{U} - \overline{D}$  is zero thus providing a zero error voltage to the VCO. This situation indicates the loop is in lock and the 12140 action will maintain the loop in its locked state.
