

FEATURES

- Slew rate: $6.1\text{V}/\mu\text{s}$
- Bandwidth: 6.6MHz
- Input/Output full swing
- Low supply current: $650\mu\text{A}$ (Typical)
- Offset Voltage: $5.1\mu\text{V}$ (Typical)
- Supply Voltage: 2.2V to 5.5V
- Operation Temperature Range: -40°C to 125°C
- Micro Size Packages: SOT23, SC70 and SOIC

APPLICATIONS

- ADC buffer
- Audio equipment
- Instrument circuit
- Stress test circuit
- Current measuring circuit
- Consumer electronics

GENERAL DESCRIPTION

The MT076X series are single, dual, and quad rail-to-rail CMOS operational amplifiers with low noise and low quiescent current. These amplifiers have the characteristics of input/output full swing, low offset, low power and stable high frequency response. These amplifiers achieve very good AC performance with 6.6MHz bandwidth, $6.1\text{V}/\mu\text{s}$ slew rate and low distortion while drawing only $650\mu\text{A}$ of quiescent current per amplifier. These amplifiers have the characteristics of low input bias current and high open-loop gain. This product adopts rail to rail input and output design, with $5.1\mu\text{V}$ offset voltage and extremely low noise.

MT076X has wide temperature range from -40°C to $+125^\circ\text{C}$.

Single or dual supplies as low as $2.2\text{V}(\pm 1.1\text{V})$ and up to $5.5\text{V}(\pm 2.75\text{V})$ can be used. And these amplifiers have good PSRR characteristics, as a result of that, they can be powered by battery without voltage regulator.

The MT0761 is available in the 5-Pin SOT23, SC70 and 8-Pin SOIC packages.

Note 1: Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

Note 2: T_J is calculated from the ambient temperature T_A and power dissipation P_D according to the following formula: $T_J = T_A + (P_D) \times (170^\circ\text{C}/\text{W})$.

Note 3: 100% production test at $+25^\circ\text{C}$. Specifications over the temperature range are guaranteed by design and characterization.

APPLICATIONS INFORMATION

MT076X are low supply voltage CMOS operational Amplifiers. This amplifier has the characteristics of Input/Output full swing, high slew rate, low supply current and high speed operation. MT076X has wide temperature range from -40°C to $+85^{\circ}\text{C}$. Single or dual supplies as low as $2.2\text{V}(\pm 1.1\text{V})$ and up to $5.5\text{V}(\pm 2.75\text{V})$ can be used.

Voltage follower

Figure 12. Voltage follower

Voltage gain is 0dB. Using this circuit, the output voltage (OUT) is configured to be equal to the input voltage (IN). This circuit also stabilizes the output voltage (OUT) due to high input impedance and low output impedance. Computation for output voltage (OUT) is shown below. $\text{OUT} = \text{IN}$.

Inverting amplifier

For inverting amplifier, input voltage (IN) is amplified by a voltage gain and depends on the ratio of R1 and R2. The out-of-phase output voltage is shown in the next expression

$$\text{OUT} = -(\text{R2}/\text{R1}) \cdot \text{IN}$$

This circuit has input impedance equal to R1.

Figure 13. Inverting amplifier circuit

Non-inverting amplifier

For non-inverting amplifier, input voltage (IN) is amplified by a voltage gain, which depends on the ratio of R1 and R2. The output voltage (OUT) is in-phase with the input voltage (IN) and is shown in the next expression.

$$\text{OUT} = (1 + \text{R2}/\text{R1}) \cdot \text{IN}$$

Effectively, this circuit has high input impedance since its input side is the same as that of the operational amplifier.
