

Voltage Detector Series

NCP304, NCP305

The NCP304 and NCP305 series are second generation ultra-low current voltage detectors. These devices are specifically designed for use as reset controllers in portable microprocessor based systems where extended battery life is paramount.

Each series features a highly accurate undervoltage detector with hysteresis which prevents erratic system reset operation as the comparator threshold is crossed.

The NCP304 series consists of complementary output devices that are available with either an active high or active low reset output. The NCP305 series has an open drain N-Channel output with an active low reset output.

The NCP304 and NCP305 device series are available in the SC-82AB package with standard undervoltage thresholds. Additional thresholds that range from 0.9 V to 4.9 V in 100 mV steps can be manufactured.

Features

- Quiescent Current of 1.0 μ A Typical
- High Accuracy Undervoltage Threshold of 2.0%
- Wide Operating Voltage Range of 0.8 V to 10 V
- Complementary or Open Drain Reset Output
- Active Low or Active High Reset Output
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These Devices are Pb-Free and are RoHS Compliant

Typical Applications

- Microprocessor Reset Controller
- Low Battery Detection
- Power Fail Indicator
- Battery Backup Detection

This device contains 38 active transistors.

* The representative block diagram depicts active low reset output 'L' suffix devices. The comparator input is interchanged for the active high output 'H' suffix devices.

This device contains 37 active transistors.

NCP304, NCP305

MAXIMUM RATINGS (Note 1)

| Rating | Symbol | Value | Unit |
|---|-----------------|------------------------------------|------|
| Input Power Supply Voltage (Pin 2) | V_{in} | 12 | V |
| Output Voltage (Pin 1) Complementary, NCP304 N-Channel Open Drain, NCP305 | V_{OUT} | -0.3 to $V_{in}+0.3$ -0.3 to 12 | V |
| Output Current (Pin 1) (Note 2) | I_{OUT} | 70 | mA |
| Thermal Resistance, Junction-to-Air | $R_{\theta JA}$ | 285 | °C/W |
| Maximum Junction Temperature | T_J | +125 | °C |
| Storage Temperature Range | T_{stg} | -55 to +150 | °C |
| Latchup Performance (Note 3) Positive Negative | $I_{LATCHUP}$ | 500 170 | mA |

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. This device series contains ESD protection and exceeds the following tests:

Human Body Model 2000 V per MIL-STD-883, Method 3015.

Machine Model Method 200 V.

2. The maximum package power dissipation limit must not be exceeded.

$$P_D = \frac{T_{J(max)} - T_A}{R_{\theta JA}}$$

3. Maximum Ratings per JEDEC standard JESD78.

In the case of N–Channel Open Drain Output Type: Output pin is pulled up with a resistance of 470 k Ω to 5.0 V, the time interval between the rising edge of V_{DD} input pulse from 0.7 V to $(+V_{DET}) + 2.0\text{ V}$ and output voltage level becoming to 2.5 V.

NCP304, NCP305

NCP304 and NCP305 series are measured with a 10 pF capacitive load. NCP305 has an additional 470 k pullup resistor connected from the reset output to +5.0 V. The reset output voltage waveforms are shown for the active low 'L' devices. The upper detector threshold, V_{DET+} is the sum of the lower detector threshold, V_{DET-} plus the input hysteresis, V_{HYS} .

OPERATING DESCRIPTION

The NCP304 and NCP305 series devices are second generation ultra-low current voltage detectors. Figures 25 and 26 show a timing diagram and a typical application. Initially consider that input voltage V_{in} is at a nominal level and it is greater than the voltage detector upper threshold (V_{DET+}), and the reset output (Pin 1) will be in the high state for active low devices, or in the low state for active high devices. If there is a power interruption and V_{in} becomes significantly deficient, it will fall below the lower detector threshold (V_{DET-}). This sequence of events causes the Reset output to be in the low state for active low devices, or in the

high state for active high devices. After completion of the power interruption, V_{in} will again return to its nominal level and become greater than the V_{DET+} . The voltage detector has built-in hysteresis to prevent erratic reset operation as the comparator threshold is crossed.

Although these device series are specifically designed for use as reset controllers in portable microprocessor based systems, they offer a cost-effective solution in numerous applications where precise voltage monitoring is required. Figure 26 through Figure 32 shows various application examples.

| Input < V_{det-} , Reset Output is Low | Input < V_{det-} , Reset Output is High |

Figure 29. Microprocessor Reset Circuit with Additional Hysteresis

Comparator hysteresis can be increased with the addition of resistor R_H . The hysteresis equations have been simplified and do not account for the change of input current I_{in} as V_{in} crosses the comparator threshold. The internal resistance, R_{in} is simply calculated using $I_{in} = 0.26 \mu\text{A}$ at 2.6 V.

V_{in} Decreasing:

$$V_{th} = \left(\frac{R_H}{R_{in}} + 1 \right) (V_{DET-})$$

V_{in} Increasing:

$$V_{th} = \left(\frac{R_H}{R_{in} \parallel R_L} + 1 \right) (V_{DET-} + V_{HYS})$$

$$V_{HYS} = V_{in \text{ Increasing}} - V_{in \text{ Decreasing}}$$

This circuit monitors the current at the load. As current flows through the load, a voltage drop with respect to ground appears across R_{sense} where $V_{sense} = I_{load} * R_{sense}$. The following conditions apply:

| | |
|--|-------------------------|
| If: | Then: |
| $I_{Load} < V_{DET-} / R_{sense}$ | Reset Output = 0 V |
| $I_{Load} \geq (V_{DET-} + V_{HYS}) / R_{sense}$ | Reset Output = V_{DD} |

Figure 31. Microcontroller Systems Load Sensing

A simple voltage monitor can be constructed by connecting several voltage detectors as shown above. Each LED will sequentially turn on when the respective voltage detector threshold ($V_{DET-} + V_{HYS}$) is exceeded. Note that detector thresholds (V_{DET-}) that range from 0.9 V to 4.9 V in 100 mV steps can be manufactured.

NOTE: The ordering information lists standard undervoltage thresholds with active low outputs. Additional active low threshold devices, ranging from 0.9 V to 4.9 V in 100 mV increments and NCP304 active high output devices, ranging from 0.9 V to 4.9 V in 100 mV increments can be manufactured. Contact your ON Semiconductor representative for availability. The electrical characteristics of these additional devices are shown in Tables 1 and 2.

*NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable.

NCVxxx: T_{low} = -40°C, T_{high} = +125°C. Guaranteed by design.
