

# Linear Regulator - Dual-Rail, Very Low-Dropout, Programmable Soft-Start 3.0 A

ON Semiconductor®

[www.onsemi.com](http://www.onsemi.com)

## NCP59744

The NCP59744 is dual-rail very low dropout voltage regulator that is capable of providing an output current in excess of 3.0 A with a dropout voltage of 75 mV typ. at full load current. The devices are stable with ceramic and other low ESR output capacitors. This series contains adjustable output voltage version with output voltage down to 0.8 V. Internal protection features consist of built-in thermal shutdown and output current limiting protection. User-programmable Soft-Start and Power Good pins are available. The NCP59744 is offered in DFN10 3x3, QFN20 5x5 and WLCSP10 packages.

### Features

- Output Current in Excess of 3.0 A
- 0.25% Typical Accuracy Over Line and Load
- $V_{IN}$  Range: 0.8 V to 5.5 V
- $V_{BIAS}$  Range: 2.2 V to 5.5 V
- Output Voltage Range: 0.8 V to 3.6 V
- Dropout Voltage: 75 mV at 3 A
- Programmable Soft Start
- Open Drain Power Good Output
- Excellent Transient Response
- Current Limit and Thermal Shutdown Protection
- These Devices are Pb-Free and are RoHS Compliant

### Applications

- Telecom and Industrial Equipment Point of Load Regulation
- FPGA, DSP and Logic Power Supplies
- Switching Power Supply Post Regulation
- Applications with Specific Start-up Time or Sequencing Requirements

### ORDERING INFORMATION

See detailed ordering, marking and shipping information in the package dimensions section on page 12 of this data sheet.

# NCP59744

**Table 1. PIN FUNCTION DESCRIPTION**

Name	DFN10	QFN20	WLCSP10	Description
IN	1, 2	5–8	A2, B2	Unregulated input to the device.
EN	5	11	E2	Enable pin. Driving this pin high enables the regulator. Driving this pin low puts the regulator into shutdown mode. This pin must not be left floating.
SS	7	15	D1	Soft-Start pin. A capacitor connected on this pin to ground sets the start-up time. If this pin is left floating, the regulator output soft-start ramp time is typically 200 $\mu$ s.
BIAS	4	10	D2	Bias input voltage for error amplifier, reference, and internal control circuits.
PG	3	9	C2	Power-Good (PG) is an open-drain, active-high output that indicates the status of $V_{OUT}$ . When $V_{OUT}$ exceeds the PG trip threshold, the PG pin goes into a high-impedance state. When $V_{OUT}$ is below this threshold the pin is driven to a low-impedance state. A pull-up resistor from 10 k $\Omega$ to 1 M $\Omega$ should be connected from this pin to a supply up to 5.5 V. The supply can be higher than the input voltage. Alternatively, the PG pin can be left floating if output monitoring is not necessary.
FB	8	16	C1	This pin is the feedback connection to the center tap of an external resistor divider network that sets the output voltage. This pin must not be left floating.
OUT	9, 10	1, 18–20	A1, B1	Regulated output voltage. It is recommended that the output capacitor $\geq 2.2 \mu$ F.
NC	N/A	2–4, 13, 14, 17	N/A	No connection. This pin can be left floating or connected to GND to allow better thermal contact to the top-side plane.
GND	6	12	E1	Ground
PAD/TAB				Should be soldered to the ground plane for increased thermal performance

**Table 2. ABSOLUTE MAXIMUM RATINGS**

Parameter	Symbol	Value	Unit
Input Voltage Range	$V_{IN}$	-0.3 to +6	V
Input Voltage Range	$V_{BIAS}$	-0.3 to +6	V
Enable Voltage Range	$V_{EN}$	-0.3 to +6	V
Power-Good Voltage Range	$V_{PG}$	-0.3 to +6	V
PG Sink Current	$I_{PG}$	0 to +1.5	mA
SS Pin Voltage Range	$V_{SS}$	-0.3 to +6	V
Feedback Pin Voltage Range	$V_{FB}$	-0.3 to +6	V
Output Voltage Range	$V_{OUT}$	-0.3 to $(V_{IN} + 0.3) \leq 6$	V
Maximum Output Current	$I_{OUT}$	Internally Limited	
Output Short Circuit Duration		Indefinite	
Continuous Total Power Dissipation	$P_D$	See Thermal Characteristics Table and Formula	
Maximum Junction Temperature	$T_{JMAX}$	+150	$^{\circ}$ C
Storage Junction Temperature Range	$T_{STG}$	-55 to +150	$^{\circ}$ C
ESD Capability, Human Body Model (Note 2)	$ESD_{HBM}$	2000	V
ESD Capability, Machine Model (Note 2)	$ESD_{MM}$	200	V

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
2. This device series incorporates ESD protection and is tested by the following methods:  
 ESD Human Body Model tested per EIA/JESD22-A114  
 ESD Machine Model tested per EIA/JESD22-A115  
 Latch-up Current Maximum Rating tested per JEDEC standard: JESD78.

# NCP59744

**Table 3. THERMAL CHARACTERISTICS**

Rating	Symbol	Value	Unit
<b>Thermal Characteristics, DFN10, 3x3, 0.5P package</b>			
Thermal Resistance, Junction-to-Ambient (Note 5)	$R_{\theta JA}$	41.5	°C/W
Thermal Resistance, Junction-to-Case (bottom) (Note 7)	$R_{\theta JC}$	6.6	°C/W
<b>Thermal Characteristics, QFN20, 5x5, 0.65P package</b>			
Thermal Resistance, Junction-to-Ambient (Note 5)	$R_{\theta JA}$	35.4	°C/W
Thermal Resistance, Junction-to-Board (Note 6)	$R_{\theta JB}$	14.7	°C/W
Thermal Resistance, Junction-to-Case (bottom) (Note 7)	$R_{\theta JC}$	3.9	°C/W
<b>Thermal Characteristics, WLCSP10 package</b>			
Thermal Resistance, Junction-to-Ambient (Note 5)	$R_{\theta JA}$	72	°C/W
Thermal Characterization Parameter, Junction-to-Case (top)	$\Psi_{JT}$	0.9	°C/W

3. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
4. Thermal data are derived by thermal simulations based on methodology specified in the JEDEC JESD51 series standards. The following assumptions are used in the simulations:
  - These data were generated with only a single device at the center of a high-K (2s2p) board with 3 in x 3 in copper area which follows the JEDEC51.7 guidelines. Top and Bottom layer 2 oz. copper, inner planes 1 oz. copper.
  - DFN10: The exposed pad is connected to the PCB ground inner layer through a 3x2 thermal via array. Vias are 0.3 mm diameter, plated. Each of top and bottom copper layers are assumed to have thermal conductivity representing 20% copper coverage.
  - QFN20: The exposed pad is connected to the PCB ground inner layer through a 4x4 thermal via array. Vias are 0.3 mm diameter, plated. Each of top and bottom copper layers has a dedicated pattern for 20% copper coverage.
5. The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a high-K board, following the JEDEC51.7 guidelines with assumptions as above, in an environment described in JESD51-2a.
6. The junction-to-board thermal resistance is simulated in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
7. The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the IC exposed pad. Test description can be found in the ANSI SEMI standard G30-88.

**Table 4. RECOMMENDED OPERATING CONDITIONS** (Note 8)

Rating	Symbol	Min	Max	Unit
Input Voltage	$V_{IN}$	$V_{OUT} + V_{DO}$	5.5	V
Bias Voltage	$V_{BIAS}$	2.2	5.5	V
Junction Temperature	$T_J$	-40	125	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

8. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.

## TYPICAL CHARACTERISTICS

At  $T_J = +25^\circ\text{C}$ ,  $V_{OUT} = 1.5\text{ V}$ ,  $V_{IN} = V_{OUT(TYP)} + 0.3\text{ V}$ ,  $V_{BIAS} = 3.3\text{ V}$ ,  $I_{OUT} = 50\text{ mA}$ ,  $V_{EN} = V_{IN}$ ,  $C_{IN} = 1\ \mu\text{F}$ ,  $C_{BIAS} = 1\ \mu\text{F}$ ,  $C_{SS} = 0.01\ \mu\text{F}$ , and  $C_{OUT} = 10\ \mu\text{F}$ , unless otherwise noted.

Figure 16. Current Limit vs. (V<sub>BIAS</sub> - V<sub>OUT</sub>)

APPLICATIONS INFORMATION

The NCP59744 dual-rail very low dropout voltage regulator is using NMOS pass transistor for output voltage regulation from  $V_{IN}$  voltage. All the low current internal control circuitry is powered from the  $V_{BIAS}$  voltage.

The use of an NMOS pass transistor offers several advantages in applications. Unlike a PMOS topology devices, the output capacitor has reduced impact on loop stability.  $V_{in}$  to  $V_{out}$  operating voltage difference can be very low compared with standard PMOS regulators in very low  $V_{in}$  applications.

The NCP59744 offers programmable smooth monotonic start-up. The controlled voltage rising limits the inrush current what is advantageous in applications with large capacitive loads. The Voltage Controlled Soft Start timing is programmable by external  $C_{SS}$  capacitor value.

The Enable (EN) input is equipped with internal hysteresis and deglitch filter.

Open Drain type Power Good (PG) output is available for  $V_{out}$  monitoring and sequencing of other devices.

NCP59744 is a Adjustable linear regulator. The required Output voltage can be adjusted by two external resistors. Typical application schematics is shown in Figure 17.

Figure 17. Typical Application Schematics

Dropout Voltage

Because of two power supply inputs  $V_{IN}$  and  $V_{BIAS}$  and one  $V_{OUT}$  regulator output, there are two Dropout voltages specified.

The first, the  $V_{IN}$  Dropout voltage is the voltage difference ( $V_{IN} - V_{OUT}$ ) when  $V_{OUT}$  starts to decrease by percents specified in the Electrical Characteristics table.  $V_{BIAS}$  is high enough, specific value is published in the Electrical Characteristics table.

The second,  $V_{BIAS}$  dropout voltage is the voltage difference ( $V_{BIAS} - V_{OUT}$ ) when  $V_{IN}$  and  $V_{BIAS}$  pins are joined together and  $V_{OUT}$  starts to decrease.

Input and Output Capacitors

The device is designed to be stable for all available types and values of output capacitors  $\geq 2.2 \mu F$ . The device is also stable with multiple capacitors in parallel, which can be of any type or value.

In applications where no low input supply impedance is available (PCB inductance in  $V_{in}$  and/or  $V_{bias}$  inputs as an example) the recommended  $C_{in}$  and  $C_{bias}$  value is  $1 \mu F$  or

greater. In order to avoid any excessive input voltage transients caused i.e. by a sudden output short circuit conditions the input capacitor value should be sized properly for each particular application to counteract any input inductance. For  $V_{in}$  of 5.5 V the recommended input capacitance is  $22 \mu F$  or greater. Ceramic or other low ESR capacitors are recommended. For the best performance all capacitors should be connected to the NCP59744 respective pins directly in the device PCB copper layer, not through vias having not negligible impedance.

Enable Operation

The enable pin will turn the regulator on or off. The threshold limits are covered in the electrical characteristics table in this data sheet. If the enable function is not to be used then the pin should be connected to  $V_{IN}$  or  $V_{BIAS}$ .

To get the full functionality of Soft-Start, it is recommended to turn on the  $V_{IN}$  and  $V_{BIAS}$  supply voltages first and activate the Enable pin no sooner than when  $V_{IN}$  and  $V_{BIAS}$  are on their nominal levels.

The NCP59744 device is equipped with Output Active Discharge transistor that is pulling the output to GND through a  $1.2 k\Omega$  (typ.) resistor when the device is disabled.

Output Noise

When the NCP59744 device reaches the end of the Soft-Start cycle, the Soft Start capacitor is switched to serve as a Noise filtering capacitor.

Output Voltage Adjust

The output voltage can be adjusted from 0.8 V to 3.6 V using resistors divider between the output and the FB input. Recommended resistor values for frequently used voltages can be found in the Table 8.

Programmable Soft-Start

The Soft-Start ramp time depends on the Soft Start charging current  $I_{SS}$ , Soft-Start capacitor value  $C_{SS}$  and internal reference voltage  $V_{REF}$ .

The Soft -Start time can be calculated using following equations:

$$t_{ss} = C_{SS} \times (V_{REF} / I_{SS}) [s, F, V, A]$$

or in more practical units

$$t_{ss} = C_{SS} \times 0.8V / 0.45 = C_{SS} \times 1.78$$

where

$t_{ss}$  = Soft-Start time in milliseconds

$C_{SS}$  = Soft-Start capacitor value in nano Farads

Capacitor values for frequently used Soft-Start times can be found in the Table 9.

The maximal recommended value of  $C_{SS}$  capacitor is 15 nF. For higher  $C_{SS}$  values the capacitor full discharging before new Soft-Start cycle is not guaranteed.

# NCP59744

## Power Good

Power-Good (PG) is an open-drain, active-high output that indicates the status of  $V_{OUT}$ . When  $V_{OUT}$  exceeds the PG trip threshold, the PG pin goes into a high-impedance state. When  $V_{OUT}$  is below this threshold the pin is driven to a low-impedance state. A pull-up resistor from 10 k $\Omega$  to 1 M $\Omega$  should be connected from this pin to a supply up to 5.5 V. The supply can be higher than the input voltage. Alternatively, the PG pin can be left floating if output monitoring is not necessary.

## Current Limitation

The internal Current Limitation circuitry allows the device to supply the full nominal current and surges but protects the device against Current Overload or Short.

## Thermal Protection

Internal thermal shutdown (TSD) circuitry is provided to protect the integrated circuit in the event that the maximum junction temperature is exceeded. When TSD activated, the regulator output turns off. When cooling down under the low temperature threshold, device output is activated again. This TSD feature is provided to prevent failures from accidental overheating.

**Table 8. RESISTOR VALUES FOR PROGRAMMING THE OUTPUT VOLTAGE**

$V_{OUT}$ (V)	$R_1$ (k $\Omega$ )	$R_2$ (k $\Omega$ )
0.8	Short	Open
0.9	0.619	4.99
1.0	1.13	4.53
1.05	1.37	4.33
1.1	1.87	4.99
1.2	2.49	4.99
1.5	4.12	4.75
1.8	3.57	2.87
2.5	3.57	1.69
3.3	3.57	1.15

NOTE:  $V_{OUT} = 0.8 \times (1 + R_1/R_2)$   
Resistors in the table are standard 1% types

**Table 9. CAPACITOR VALUES FOR PROGRAMMING THE SOFT-START TIME**

Soft-Start Time	$C_{SS}$
0.2 ms	Open
0.5 ms	270 pF
1 ms	560 pF
5 ms	2.7 nF
10 ms	5.6 nF
18 ms	10 nF
