General Description

The HT8631/2/4 are CMOS op-amps with low offset, stable high frequency response, low power, low supply voltage, and rail-to-rail inputs and outputs.

HT8631/2/4 have a high gain-bandwidth product of 6MHz, 3.7V/ μ s slew rate while consuming only 380 μ A of supply current per amplifier. The maximum input offset and rail-to-rail output characteristics allow the full power-supply voltage to be used for signal range. The operating range is from 2.5V to 5.5V.

This combination of features makes the HT8631/2/4 superior among rail-to-rail input/output CMOS op amps in its power class. It is specified over the extended industrial temperature range -40°C to +125°C.

The HT8631/2/4 can be used as cost-effective plug-in replacements for many commercially available op amps to reduce power and improve input/output range and performance.

PIN Definition

Name	I/O	Analog/Digital	Description
INP	I	A	Non-Inverting Input of Amplifier. Voltage range of this pin can go from 0 to VDD.
GND	GROUND	GROUND	Ground pin. Connect to the most negative supply, ALL GND pads are connected on die.
INN	I	A	Inverting Input of Amplifier. This pin has same voltage range as INP.
OUT	O	A	Amplifier Output. The voltage range extends to within millivolts of each supply rail.
VDD	POWER	POWER	Power supply (5V) ,connect to positive voltage supply

Application Circuits

The HT8631/2/4 of operational amplifier can operate with power supply voltages from 2.5V to 5.5V. Each amplifier draws only 330uA quiescent current. The HT8631/2/4 can driver larger capacitive loads in unity-gain without oscillation. The unity-gain follower (buffer) is the most sensitive configuration to capacitive loading. When driving large capacitive loads with the HT8631/2 OPA, a small series resistor at the output improves the feedback loop's phase margin and stability by making the output load resistive at higher frequencies.
