SPECIFICATION FOR ESK TYPE CAPACITOR

1. General

1.1 Applicable range of the specification

This specification applies to the fixed metallized polyester film dielectric capacitors used for general purpose circuit application.

1.2 Environmental conditions for test

Unless otherwise prescribed in other related specification, the test of this capacitor shall be performed under the temperature range from 15°C to 35°C and the R.H. ranges from 45% to 85%. However, if there is any doubt about the judgment of the measurement, the test shall be performed at $20 \pm 2^\circ\text{C}$ and $65\% \pm 5\% \text{ RH}$.

1.3 Reference specification

1.3.1 IEC 60384-1, 60384-2

2. Structure and Dimensions

2.1 Configuration and dimensions

The configuration of the capacitor and its dimensions shall be in compliance with the drawings and tables shown on page 1 and the attached sheet(s) therewith.

2.2 Structure

This flat radial lead type capacitor is comprised metallized polyester film and is encased and filled with epoxy.

2.3 Wire lead

The wire leads used is tinned copper clad steel wire or tinned copper wire upon customer requirement.

SPECIFICATION FOR ESK TYPE CAPACITOR

3. Mechanical performance

3.1 Tensile strength of the terminal

When 1 kg load is gradually and continuously applied to the either lead of the capacitor, along the wire lead direction, with the capacitor body being fixed, the wire lead shall be free from being damaged.

3.2 Bending strength of the terminal

The capacitor to be tested shall be kept such that its wire leads point to the perpendicular direction, and a 0.5 kg load is applied on the tip of the wire lead. The capacitor body shall be bended to 90° with respecting to its wire leads in 1- 2 seconds, and thereafter the capacitor body shall be returned to its original position in the same time period. Then the capacitor body shall be bended 90° to opposite direction and thereafter it is returned to its original position in the same period. This operation constitutes one bending. The wire leads shall withstand shall withstand 2 bending without being damaged.

3.3 Soldering heat resistance

The wire lead to be tested shall be immersed in the flux which shall consist of 25% by weight of colophony in 75% by weight of 2-propanol (isopropanol) or of ethyl alcohol. Then the wire lead shall be immersed in the solder pot, which shall be kept at $260\text{ }^{\circ}\text{C} \pm 5^{\circ}\text{C}$ for 5.0 ± 1.0 sec. Then leave the wire lead in normal condition for not less than 4 hours. The following requirement shall be met.

Appearance	No distinguished change is observed
Cap. change	Within $\pm 3\%$
D.F. change	Less than 150% of before test

SPECIFICATION FOR ESK TYPE CAPACITOR

3.4 Solderability test

Test shall be performed with referring to IEC Publication 68-2-20 method 1 (as fig. 1). The surface of the leads immersed in the solder shall be covered with new solder for more than 95%.

3.4.1 test conditions:

- a. bath temperature: 235 ± 5
- b. immersion time: 2.0 ± 0.5 sec.
- c. depth of immersion : as shown in fig. 1

SPECIFICATION FOR ESK TYPE CAPACITOR

4. Electric performance

4.1 Capacitance

The capacitance of the capacitor shall be within the specified tolerance of the rated nominal value when it is measured to 0.5% accuracy with a signal of 1 Vrms max. at 1000 ± 200 Hz.

4.2 Dissipation Factor (DF)

The DF value of the capacitor shall be less than that specified in the table below when it is measured at the frequency specified in the same table.

cap \ DF	freq.	1000 Hz
$C \leq 0.1\mu\text{F}$		1.0%
$0.1 \mu\text{F} < C \leq 1.5\mu\text{F}$		1.0%
$1.5\mu\text{F} < C$		1.0%

4.3 Voltage withstanding

Applying 160% of the rated voltage between the 2 terminals of the capacitor for 2 seconds, the capacitor shall be no permanent short circuit failure. The capacitor shall be charged and discharge through a resistor which limits the charge/discharge current to 0.1 A max.

4.4 Insulation resistance (IR)

The insulation resistance of the capacitor measured between the 2 terminals of the capacitor shall be no less than $15,000 \text{ M}\Omega$ for the capacitance less than 0.33 μf , and RC value shall be higher than $5,000 \text{ M}\Omega\text{-}\mu\text{F}$ for $C \geq 0.33 \mu\text{f}$. The capacitor shall be charged with rated voltage or 500 VDC, whichever is lower, for 1 minute, and thereafter the measurement readings shall be read in 1 minute.

SPECIFICATION FOR ESK TYPE CAPACITOR

5. Marking

Unless being otherwise specified, the capacitor shall be marked legibly showing the following items.

5.1 Rated nominal capacitance in uf (micro farad) or otherwise specified.

5.2 Capacitance tolerance symbol ; J ($\pm 5\%$), K ($\pm 10\%$), ...

6. Packing

6.1 The capacitors shall be packed together with desiccant in a polyethylene bag to prevent the capacitors from being moistened or damaged during transportation or in storage. The units can also be taped either in reel or Ammo packed for auto-insertion purpose.

7. Guaranteed period in store

7.1 The guaranteed period of the capacitor is 12 months from the shipping date provided the capacitor is packed in the original bag.

7.2 When the capacitor is unpacked, it shall be used within one month. Throughout that period the capacitor shall be packed in a polyethylene bag for preventing moisture absorption.

SPECIFICATION FOR ESK TYPE CAPACITOR

8. Environmental Test

8.1 Load life test

Capacitors shall be placed in an environmental test chamber, which the temperature shall be kept at $85 \pm 3^{\circ}\text{C}$, with 125 % rated voltage applied onto the 2 leads of the capacitor for testing 1000 ± 16 hrs. After the test completed, the capacitors shall be conditioned at room temperature for at least 4 hrs. and meet the following criteria.

- a. Capacitance change shall be less than $\pm 5\%$.
- b. Dissipation Factor shall be less than 120% of max. DF value.
- c. Insulation Resistance shall be higher than 50% of the min. IR value specified.
- d. Dielectric strength shall withstand 120% of rated voltage for 5 seconds
- e. without permanent short-circuited.

8.2 Humidity test

Capacitors are subjected to an environmental test chamber, which is kept at $40 \pm 2^{\circ}\text{C}$ with R.H. 90 - 95%, for test 240 hours. After the test, the capacitors shall be conditioned at room temperature for at least 2 hours and meet the following criteria.

- a. Capacitance change shall be less than $\pm 5\%$.
- b. Dissipation Factor shall be less than 120% of max. DF value.
- c. Insulation Resistance shall be higher than 50% of the min. IR value specified.
- d. Dielectric strength shall withstand 120% of rated voltage for 5 seconds
- e. without permanent short-circuited.

8.3 Temperature Coefficient

Capacitors are measured capacitance at the temperature cycle (20 minutes at each step), as follows: $+20^{\circ}\text{C} \rightarrow -40^{\circ}\text{C} \rightarrow +20^{\circ}\text{C} \rightarrow +85^{\circ}\text{C} \rightarrow +20^{\circ}\text{C}$, the temperature coefficient of capacitance shall be 400 ± 200 ppm/ $^{\circ}\text{C}$
