

1 A ultra low-dropout regulator with reverse current protection

DFN8 (3 x 3 mm)

Features

- Input voltage range: 2.2 V to 5.5 V
- Ultra low-dropout: 200 mV typ. at 1 A
- NMOS topology
- Very high PSRR: 78 dB @ 100 Hz, 70 dB @ 100 kHz
- Very fast response to load variation
- Stable with 1 μ F capacitor
- Thermal shutdown
- Current limit
- Adjustable from 1.2 V
- High output voltage accuracy: 1 % typ. (3 % max.)

Applications

- Post-regulation generic POL
- Portable equipment
- Industrial applications
- Telecom infrastructure

Description

The **LD59100** is a 1 A LDO regulator designed for use in various environments. Its N-MOS topology allows reduction of the R_{dson} of the pass-element, maintaining a very low-dropout voltage even with very low input power supply voltage.

The device features very high PSRR characteristics over a wide frequency band, rendering it suitable for use as a secondary regulator for noise-sensitive applications.

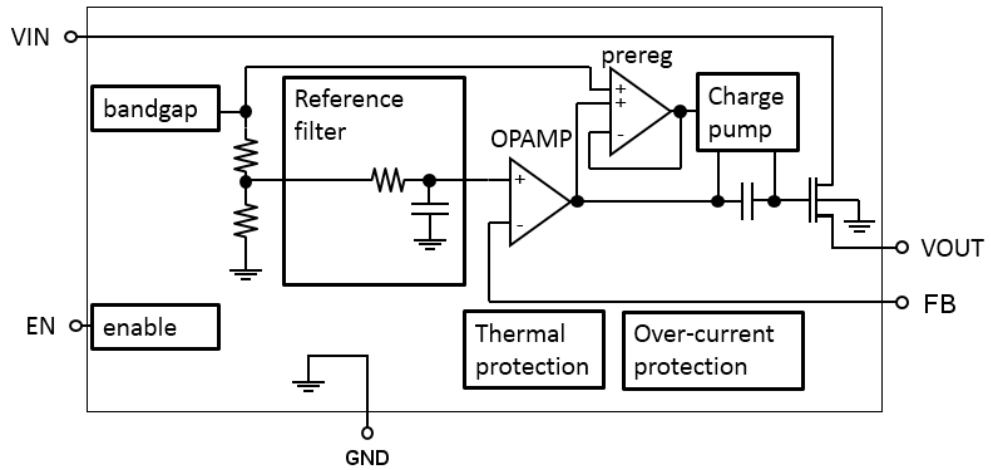

The enable function can be used to further decrease the overall current consumption in shutdown mode.

The **LD59100** embeds protection features, such as current limit, thermal shutdown and reverse output current protection.

6 Application information

6.1 Output voltage setting for adjustable version

In the adjustable version, the output voltage can be set from 1.204 V (V_{FB}) up to the input voltage minus the voltage drop across the pass transistor (dropout voltage), by connecting a resistor divider between the FB pin and the output, thereby implementing remote voltage sensing. With reference to the typical circuit shown in [Figure 4. Line regulation vs. temperature](#) ($V_{IN} = 2.5$ to 5.5 V, $V_{OUT} = V_{FB}$, $I_{OUT} = 10$ mA), the resistor divider can be designed by using the following equation:

Equation 1

$$V_{OUT} = V_{FB} (1 + R_1/R_2), \text{ with } V_{FB} = 1.204 \text{ V typ.} \quad (1)$$

It is recommended to use resistors with values in the range of 10 k Ω to 100 k Ω . Lower values can also be suitable, but will result in an increase in current consumption.

The following table shows an example of R_1 , R_2 choices, among standard 1% resistors, to obtain the most common output voltages.

Table 6. Resistor divider settings for common output voltages

V_{OUT}	R_1	R_2
1.204 (V_{FB})	Short	Open
1.5	23.2 k Ω	95.3 k Ω
1.8	28.0 k Ω	56.2 k Ω
2.5	39.2 k Ω	36.5 k Ω
2.8	44.2 k Ω	33.2 k Ω
3	46.4 k Ω	30.9 k Ω
3.3	52.3 k Ω	30.1 k Ω

6.2 Input and output capacitors

Input capacitor

An input capacitor with a minimum value of 1 μ F must be located as close as possible to the input pin of the device and returned to a clean analog ground. A good quality, low-ESR ceramic capacitor is recommended. This capacitor helps to ensure stability of the control loop, reduces the effects of inductive sources and improves ripple rejection. A capacitance value larger than 1 μ F can be used in the case of fast load transients in the application.

Output capacitor

The LD59100 requires a capacitor connected to its output, to keep the control loop stable and reduce the risk of ringing and oscillations. The control loop is designed to be stable with any good quality ceramic capacitor (such as X5R/X7R types) with a minimum value of 1 μ F and equivalent series resistance in the 5 m Ω to 1 Ω range. It is important to highlight that the output capacitor must maintain its capacitance and ESR in the stable region over the full operating temperature, load and input voltage ranges, to assure stability. Therefore, capacitance and ESR variations must be taken into account in the design phase to ensure the device works in the expected stability region. There is no maximum limit to the output capacitance, provided that the above conditions are respected.
