

# Isolated High Current IGBT Gate Driver

## NCV57001F

NCV57001F is a variant of NCV57001 with reduced Soft-Turn-Off time suited to drive large IGBTs or power modules. NCV57001F is a high-current single channel IGBT driver with internal galvanic isolation, designed for high system efficiency and reliability in high power applications. Its features include complementary inputs, open drain FAULT and Ready outputs, active Miller clamp, accurate UVLOs, DESAT protection, and soft turn-off at DESAT. NCV57001F accommodates both 5 V and 3.3 V signals on the input side and wide bias voltage range on the driver side including negative voltage capability. NCV57001F provides >5 kVrms (UL1577 rating) galvanic isolation and >1200 V<sub>form</sub> (working voltage) capabilities. NCV57001F is available in the wide-body SOIC-16 package with guaranteed 8 mm creepage distance between input and output to fulfill reinforced safety insulation requirements.

### Features

- High Current Output (+4/-6 A) at IGBT Miller Plateau Voltages
- Low Output Impedance for Enhanced IGBT Driving
- Short Propagation Delays with Accurate Matching
- Active Miller Clamp to Prevent Spurious Gate Turn-on
- DESAT Protection with Programmable Delay
- Typ 550 ns Soft Turn Off during IGBT Short Circuit
- IGBT Gate Clamping during Short Circuit
- IGBT Gate Active Pull Down
- Tight UVLO Thresholds for Bias Flexibility
- Wide Bias Voltage Range including Negative VEE2
- 3.3 V to 5 V Input Supply Voltage
- 5000 V Galvanic Isolation (to meet UL1577 requirements)
- 1200 V Working Voltage (per VDE0884-10 requirements)
- High transient immunity
- High electromagnetic immunity
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- This Device is Pb-Free, Halogen Free/BFR Free and is RoHS Compliant

### Typical Applications

- Automotive Power Supplies
- HEV/EV Powertrain
- BSG Inverter
- PTC Heater

**Table 1. PIN FUNCTION DESCRIPTION**

Pin Name	No.	I/O	Description
V <sub>EE2A</sub>	1	Power	Output side negative power supply. A good quality bypassing capacitor is required from these pins to GND2 and should be placed close to the pins for best results. Connect it to GND2 for unipolar supply application.
V <sub>EE2</sub>	8		
DESAT	2	I/O	<p>Input for detecting the desaturation of IGBT due to a short circuit condition. An internal constant current source I<sub>DESAT-CHG</sub> charging an external capacitor connected to this pin allows a programmable blanking delay every ON cycle before DESAT fault is processed, thus preventing false triggering. When the DESAT voltage goes up and reaches V<sub>DESAT-THR</sub>, the output is driven low. Further, the <math>\overline{FLT}</math> output is activated, please refer to Figure 5.</p> <p>A 5 <math>\mu</math>s mute time apply to IN+ and IN- once DESAT occurs.</p>
GND2	3	Power	Output side gate drive reference connecting to IGBT emitter or FET source.
N/C	4	--	Not connected.
V <sub>DD2</sub>	5	Power	Output side positive power supply. The operating range for this pin is from UVLO2 to its maximum allowed value. A good quality bypassing capacitor is required from this pin to GND2 and should be placed close to the pins for best results.
OUT	6	O	Driver output that provides the appropriate drive voltage and source/sink current to the IGBT/FET gate. OUT is actively pulled low during start-up and under Fault conditions.
CLAMP	7	I/O	Provides clamping for the IGBT/FET gate during the off period to protect it from parasitic turn-on. Its internal N FET is turned on when the voltage of this pin falls below V <sub>EE2</sub> + V <sub>CLAMP-THR</sub> . It is to be tied directly to IGBT/FET gate with minimum trace length for best results.
GND1	9	Power	Input side ground reference.
	16		
IN+	10	I	Non inverted gate driver input. It is internally clamped to V <sub>DD1</sub> and has a pull-down resistor of 50 k $\Omega$ to ensure that output is low in the absence of an input signal. A minimum positive going pulse-width is required at IN+ before OUT responds.
IN-	11	I	Inverted gate driver input. It is internally clamped to V <sub>DD1</sub> and has a pull-up resistor of 50 k $\Omega$ to ensure that output is low in the absence of an input signal. A minimum negative going pulse-width is required at IN- before OUT responds.
RDY	12	O	<p>Power good indication output, active high when V<sub>DD2</sub> is good. There is an internal 50 k<math>\Omega</math> pull-up resistor connected to this pin. Multiple of them from different drivers can be "OR"ed together.</p> <p>If a low RDY event is triggered by UVLO2, the maximum low duration for RDY is 200 ns.</p> <p>OUT remains low when RDY is low. Short time delay may apply. See Figure 4 for details.</p>
$\overline{FLT}$	13	O	Fault output (active low) that allows communication to the main controller that the driver has encountered a desaturation condition and has deactivated the output.
RST	14	I	Reset input with an internal 50 k $\Omega$ pull-up resistor, active low to reset fault latch.
V <sub>DD1</sub>	15	Power	Input side power supply (3.3 V to 5 V).
