

Description

The F1455 is a High Gain / High Linearity 1400 MHz to 2300 MHz TX Digital Variable Gain Amplifier used in transmitter applications.

The F1455 TX DVGA provides 32.8 dB maximum gain with +38.5 dBm OIP3 and 3.9 dB noise figure. Up to 29.5 dB gain control is achieved using the combination of a digital step attenuator (DSA) and a K_{LIN}^{TM} RF Digital Gain Amplifier. This device uses a single 5 V supply and 220 mA of I_{CC} .

This device is packaged in a 6 mm x 6 mm, 28-pin QFN with 50 Ω single-ended RF input and RF output impedances for ease of integration into the signal-path.

Competitive Advantage

In typical Base Stations, RF VGAs are used in the TX traffic paths to drive the transmit power amplifier. The F1455 TX DVGA offers very high reliability due to its construction from a monolithic silicon die in a QFN package. The F1455 is configured to provide an optimum balance of noise and linearity performance consisting of a K_{LIN}^{TM} RF amplifier, digital step attenuator (DSA) and a PA driver amplifier. The K_{LIN}^{TM} amplifier maintains the OIP3 and output P1dB performance over an extended attenuation range when compared to competitive devices.

Typical Applications

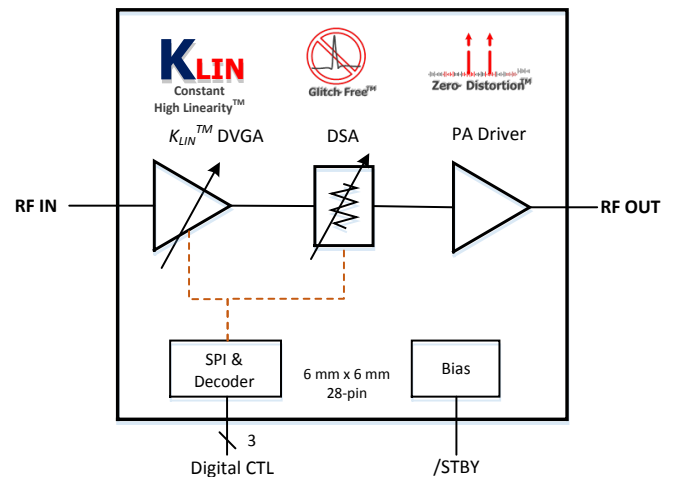

- Multi-mode, Multi-carrier Transmitters
- PCS1900 Base Stations
- DCS1800 Base Stations
- WiMAX and LTE Base Stations
- UMTS/WCDMA 3G Base Stations
- PHS/PAS Base Stations
- Public Safety Infrastructure

Features

- Broadband 1400 MHz to 2300 MHz
- 32.8 dB max gain
- 3.9 dB NF @ max gain (2000 MHz)
- 29.5 dB total gain control range, 0.5 dB step
- < 2 dB overshoot between gain transitions
- Maintains flat +23 dBm OP1dB for more than 13 dB gain adjustment range
- Maintains flat +38.5 dBm OIP3 for more than 15 dB gain adjustment range
- SPI interface for DSA control
- Single 5 V supply voltage
- $I_{CC} = 220$ mA
- Up to +105 °C T_{CASE} operating temperature
- 50 Ω input and output impedance
- Standby mode for power savings
- Pin compatible with 700 MHz and 2700 MHz versions
- 6 mm x 6 mm, 28-pin QFN package

Pin Descriptions

Table 1. Pin Descriptions

Number	Name	Description
1	CSb	Chip Select Input: 1.8 V or 3.3 V logic compatible.
2	DATA	Data Input: 1.8 V or 3.3 V logic compatible.
3	CLK	Clock Input: 1.8 V or 3.3 V logic compatible.
4 [a]	RSET	Connect 1.74 k Ω external resistor to GND to set amplifier bias.
5, 7, 15, 17, 21, 23, 27	GND	Pins internally tied to exposed paddle. Connect to ground on PCB.
6	RFIN	RF input internally matched to 50 Ω . Must use external DC block.
8, 9, 10, 11, 12, 13, 18, 19, 20, 22, 24, 25, 26	NC	No internal connection. These pins can be left unconnected, voltage applied, or connected to ground (recommended).
14	/STBY	Standby pin. With Logic Low applied to this pin or with this pin left open, the amplifier is powered off with the SPI still powered on. With Logic High applied to this pin the part is in full operation mode.
16	RFOUT	RF output internally matched to 50 Ω . Must use external DC block.
28	VCC	5 V Power Supply. Connect to V _{cc} and use bypass capacitors as close to the pin as possible.
	— EP	Exposed Pad. Internally connected to GND. Solder this exposed pad to a PCB pad that uses multiple ground vias to provide heat transfer out of the device into the PCB ground planes. These multiple ground vias are also required to achieve the noted RF performance.

- a. External resistor on pin 4 used to optimize the overall device for DC current and linearity performance across the entire frequency band.

Absolute Maximum Ratings

Stresses above those listed below may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 2. Absolute Maximum Ratings

Parameter	Symbol	Minimum	Maximum	Units
V _{CC} to GND	V _{CC}	-0.5	5.5	V
DATA, CSb, CLK, /STBY	V _{Cntrl}	-0.5	V _{CC}	V
RSET	I _{RSET}		+1.5	mA
RFIN externally applied DC voltage	V _{RFIN}	+1.4	+3.6	V
RFOUT externally applied DC voltage	V _{RFOUT}	V _{CC} - 0.15	V _{CC} + 0.15	V
RF Input Power (RFIN) applied for 24 hours max. [a]	P _{max_in}		+12	dBm
RF Output Power (RFOUT) present for 24 hours maximum [a]	P _{max_out}		+26	dBm
Continuous Power Dissipation	P _{diss}		1.75	W
Junction Temperature	T _j		150	°C
Storage Temperature Range	T _{st}	-65	150	°C
Lead Temperature (soldering, 10s)			260	°C
ElectroStatic Discharge – HBM (JEDEC/ESDA JS-001-2012)			2000 (Class 2)	V
ElectroStatic Discharge – CDM (JEDEC 22-C101F)			1000 (Class C3)	V

- a. Exposure to these maximum RF levels can result in significantly higher I_{CC} current draw due to overdriving the amplifier stages.

Recommended Operating Conditions

Table 3. Recommended Operating Conditions

Parameter	Symbol	Condition	Minimum	Typical	Maximum	Units
Power Supply Voltage	V_{CC}		4.75		5.25	V
Operating Temperature Range	T_{CASE}	Exposed Paddle	-40		+105	°C
RF Frequency Range	F_{RF}		1400		2300	MHz
Maximum Operating Average RF Output Power		$Z_S = Z_L = 50 \Omega$			14	dBm
RFIN Port Impedance	Z_{RFI}	Single Ended		50		Ω
RFOUT Port Impedance	Z_{RFO}	Single Ended		50		Ω

Electrical Characteristics - General

See Typical Application Circuit. Unless otherwise stated, specifications apply when operated as a TX VGA, $V_{CC} = +5.0\text{ V}$, $F_{RF} = 1.88\text{ GHz}$, $T_{CASE} = +25\text{ }^{\circ}\text{C}$, $/\text{STBY} = \text{High}$, $Z_S = Z_L = 50\ \Omega$, maximum gain setting.

Table 4. Electrical Characteristics

Parameter	Symbol	Condition	Minimum	Typical	Maximum	Units
Logic Input High Threshold	V_{IH}	JEDEC 1.8V or 3.3V logic	1.1 ^[a]		V_{CC}	V

Junction to Case Thermal Resistance. (Case is defined as the exposed paddle)	θ_{JC}	4	°C/W
Moisture Sensitivity Rating (Per J-STD-020)		MSL 1	

Typical Operating Conditions (TOC)

Unless otherwise stated the typical operating graphs were measured under the following conditions:

- $V_{CC} = 5.0\text{ V}$
- $Z_L = Z_S = 50\text{ Ohms Single Ended}$
- $F_{RF} = 1.88\text{ GHz}$
- $T_{CASE} = +25\text{ °C}$
- /STBY = High
- 5 MHz Tone Spacing
- Gain setting = Maximum Gain
- All temperatures are referenced to the exposed paddle
- ACLR measurements used with a Basic LTE FDD Downlink 20 MHz TM1.2 Test signal
- EVM measurements used with a Basic LTE FDD Downlink 20 MHz TM3.1 Test signal
- Note TN1: Atten $\leq 4\text{ dB}$ Fixed Pout = 7 dBm per waveform or per tone, Atten $> 4\text{ dB}$ Fixed Pin = -21 dBm per waveform or per tone
- Note TN2: Atten $\leq 7\text{ dB}$ Fixed Pout = 10.5 dBm per waveform or per tone, Atten $> 7\text{ dB}$ Fixed Pin = -14.5 dBm per waveform or per tone
- Evaluation Kit traces and connector losses are de-embedded

0	0	0	1	0	0	29.5 dB
0	0	0	0	1	1	29.5 dB
0	0	0	0	1	0	29.5 dB
0	0	0	0	0	1	29.5 dB
0	0	0	0	0	0	29.5 dB

a. The attenuation setting is designed to operate from 0 dB (111111) to 29.5 dB (000100).

Figure 50. Serial Register Timing Diagram

Figure 51. SPI Timing Diagram

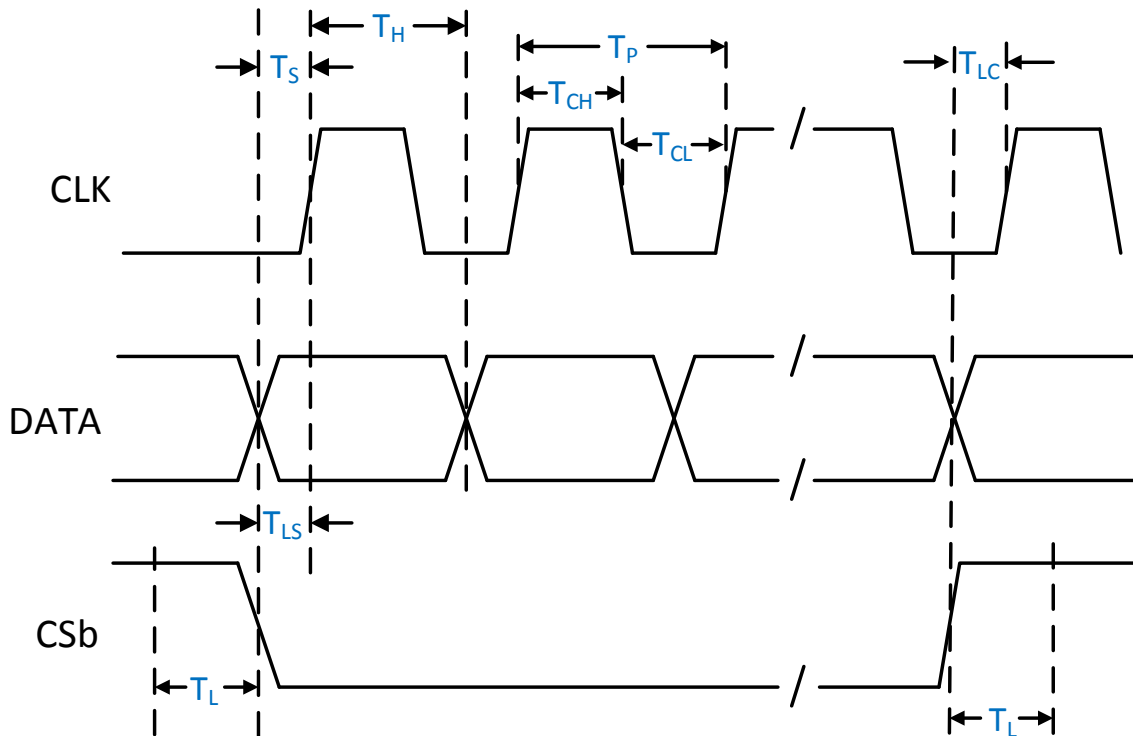

Table 8. SPI Timing Diagram Values for Figure 51

Parameter	Symbol	Test Condition	Min	Typ	Max	Units
CLK Frequency	F_C				25	MHz
CLK High Duration Time	T_{CH}		20			ns
CLK Low Duration Time	T_{CL}		20			ns
DATA to CLK Setup Time	T_S		5			ns
CLK Period [a]	T_P		40			ns
CLK to DATA Hold Time	T_H		5			ns
CSb to CLK Setup Time	T_{LS}		5			ns
CSb Trigger Pulse Width	T_L		10			ns
CSb Trigger to CLK Setup Time [b]	T_{LC}		5			ns

a. $(T_{CH} + T_{CL}) \geq 1/F_C$
 b. Once all desired DATA is clocked in, T_{LC} represents the time a CSb high needs to occur before any subsequent CLK signals.

Table 9. Standby Truth Table

/STBY (pin 14)	Condition
0 V	Amplifier OFF with SPI powered ON
V_{CC}	Full operation

Application Information

The F1455 has been optimized for use in high performance RF applications from 1700 MHz to 2300 MHz. The device maintains good performance outside of the optimized band as shown by the Typical Performance Characteristics.

Power Up Attenuation Setting

When the part is initially powered up, the default VGA setting is the 29.5 dB [000000] attenuation state.

Chip Select (CSb)

When CSb is set to logic high, the CLK input is disabled. When CSb is set to logic low, the CLK input is enabled and the DATA word can be programmed into the shift registers. The programmed word is then latched into the F1455 on the CSb rising edge (refer to Figure 51). The operation of the SPI bus is independent of the /STBY pin setting (see Standby Mode section below).

Standby Mode (/STBY)

The F1455 has a power down feature for power savings. Connecting pin 14 to a logic high will enable the device. With a logic low applied to pin 14 or with pin 14 left open (internal 1 MΩ pull down to ground) the amplifier is placed in standby mode. The Standby mode is a high isolation state. The level of this isolation is not specified and is dependent on the device. In Standby mode the SPI bus is operational and the device attenuation setting can be programmed. Therefore, the device will present the desired attenuation when it is enabled.

Power Supplies

A common V_{CC} power supply should be used for all power supply pins. To minimize noise and fast transients de-coupling capacitors should be placed at all supply pins. Supply noise can degrade noise figure and fast transients can trigger ESD clamps causing them to fail. Supply voltage change or transients should have a slew rate smaller than 1 V / 20 μs. In addition, all control pins should remain at 0 V (± 0.3 V) while the supply voltage ramps or while it returns to zero.

Control Pin Interface

If control signal integrity is a concern and clean signals cannot be guaranteed due to overshoot, undershoot, ringing, etc., the following circuit at the input of each control pin is recommended. This applies to SPI and control pins 1, 2, 3 and 14 as shown below. Note the recommended resistor and capacitor values do not necessarily match the EV kit BOM for the case of poor control signal integrity. For multiple devices driven by a single control line, the component values will need to be adjusted accordingly so as not to load down the control line.

Figure 52. Control Pin Interface for Signal Integrity

Evaluation Kit Operation

Standby

Connector J6 allows the F1455 to be put into the standby mode (STBY). Making no connection or connecting J6 pin 2 (the center pin) to V_{cc} the amplifier will be placed in normal operating mode. To put the F1455 into standby mode for very low power consumption ground J6 pin 2 (the center pin).

Figure 56. Image of J6 connector for Standby mode control

Serial Programming Pins

Connector J7 pins 1, 2, 4, 6, 8 are ground. Pin 3 is DATA, pin 5 is Clock (CLK), pin 7 is Chip Select (CSB).
