

## DS99R101/DS99R102 3-40MHz DC-Balanced 24-Bit LVDS Serializer and Deserializer

Check for Samples: [DS99R101](#), [DS99R102](#)

### FEATURES

- 3 MHz–40 MHz Clock Embedded and DC-Balancing 24:1 and 1:24 Data Transmissions
- User Selectable Clock Edge for Parallel Data on Both Transmitter and Receiver
- Internal DC Balancing Encode/Decode – Supports AC-Coupling Interface with No External Coding Required
- Individual Power-Down Controls for Both Transmitter and Receiver
- Embedded Clock CDR (Clock and Data Recovery) on Receiver and No External Source of Reference Clock Needed
- All Codes RDL (Random Data Lock) to Support Live-Pluggable Applications
- LOCK Output Flag to Ensure Data Integrity at Receiver Side
- Balanced  $T_{\text{SETUP}}/T_{\text{HOLD}}$  Between RCLK and RDATA on Receiver Side
- PTO (Progressive Turn-On) LVCMOS Outputs to Reduce EMI and Minimize SSO Effects
- All LVCMOS Inputs and Control Pins Have Internal Pulldown
- On-Chip Filters for PLLs on Transmitter and

### Receiver

- 48-Pin TQFP Package
- Pure CMOS .35  $\mu\text{m}$  Process
- Power Supply Range 3.3V  $\pm$  10%
- Temperature Range 0°C to +70°C
- 8 kV HBM ESD Tolerance

### DESCRIPTION

The DS99R101/DS99R102 Chipset translates a 24-bit parallel bus into a fully transparent data/control LVDS serial stream with embedded clock information. This single serial stream simplifies transferring a 24-bit bus over PCB traces and cable by eliminating the skew problems between parallel data and clock paths. It saves system cost by narrowing data paths that in turn reduce PCB layers, cable width, and connector size and pins.

The DS99R101/DS99R102 incorporates LVDS signaling on the high-speed I/O. LVDS provides a low power and low noise environment for reliably transferring data over a serial transmission path. By optimizing the serializer output edge rate for the operating frequency range EMI is further reduced.

Internal DC balanced encoding/decoding is used to support AC-Coupled interconnects.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

**Block Diagram**

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

**Absolute Maximum Ratings (1)(2)**

Supply Voltage (V <sub>DD</sub> )		-0.3V to +4V
LVC MOS/LVTTL Input Voltage		-0.3V to (V <sub>DD</sub> + 0.3V)
LVC MOS/LVTTL Output Voltage		-0.3V to (V <sub>DD</sub> + 0.3V)
LVDS Receiver Input Voltage		-0.3V to 3.9V
LVDS Driver Output Voltage		-0.3V to 3.9V
LVDS Output Short Circuit Duration		10 ms
Junction Temperature		+150°C
Storage Temperature		-65°C to +150°C
Lead Temperature (Soldering, 4 seconds)		+260°C
Maximum Package Power Dissipation Capacity	48L TQFP	
Package De-rating:		1/θ <sub>JA</sub> °C/W above +25°C
DS99R101	θ <sub>JA</sub>	45.8 (4L <sup>(3)</sup> ); 75.4 (2L <sup>(3)</sup> ) °C/W
	θ <sub>JC</sub>	21.0°C/W
DS99R102	θ <sub>JA</sub>	45.4 (4L <sup>(3)</sup> ); 75.0 (2L <sup>(3)</sup> ) °C/W
	θ <sub>JC</sub>	21.1°C/W
ESD Rating (HBM)		≥±8 kV

- (1) "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the Recommended Operating Conditions is not implied. The Recommended Operating Conditions indicate conditions at which the device is functional and the device should not be operated beyond such conditions.
- (2) If Military/Aerospace specified devices are required, please contact the TI Sales Office/Distributors for availability and specifications.
- (3) JEDEC

## Recommended Operating Conditions

	Min	Nom	Max	Units
Supply Voltage ( $V_{DD}$ )	3.0	3.3	3.6	V
Operating Free Air Temperature ( $T_A$ )	0	+25	+70	°C
Clock Rate	3		40	MHz
Supply Noise			±100	mV <sub>P-P</sub>

## Electrical Characteristics<sup>(1)(2)(3)</sup>

Over recommended operating supply and temperature ranges unless otherwise specified.

Symbol	Parameter	Conditions	Pin/Freq.	Min	Typ	Max	Units
<b>LVCMOS/LVTTL DC SPECIFICATIONS</b>							
$V_{IH}$	High Level Voltage		Tx: DIN[23:0], TCLK, TPWDNB, DEN, TRFB, DCAOFF, DCBOFF, VODSEL Rx: RPWDNB, RRFB, REN	2.0	1.5	$V_{DD}$	V
$V_{IL}$	Low Level Input Voltage			GND	1.5	0.8	
$V_{CL}$	Input Clamp Voltage	$I_{CL} = -18 \text{ mA}^{(4)}$			-0.8	-1.5	V
$I_{IN}$	Input Current	$V_{IN} = 0V \text{ or } 3.6V$	Tx: DIN[23:0], TCLK, TPWDNB, DEN, TRFB, DCAOFF, DCBOFF, VODSEL	-10	±5	+10	µA
			Rx: RPWDNB, RRFB, REN	-20	±5	+20	µA
$V_{OH}$	High Level Output Voltage	$I_{OH} = -4 \text{ mA}$	Rx: ROUT[23:0], RCLK, LOCK	2.3	3.0	$V_{DD}$	V
$V_{OL}$	Low Level Output Voltage	$I_{OL} = +4 \text{ mA}$		GND	0.33	0.5	V
$I_{OS}$	Output Short Circuit Current	$V_{OUT} = 0V^{(4)}$		-40	-70	-110	mA
$I_{OZ}$	TRI-STATE™ Output Current	RPWDNB, REN = 0V $V_{OUT} = 0V \text{ or } 2.4V$	Rx: ROUT[23:0], RCLK, LOCK	-15	±0.4	+15	µA
<b>LVDS DC SPECIFICATIONS</b>							
$V_{TH}$	Differential Threshold High Voltage	$V_{CM} = +1.2V$	Rx: $R_{IN+}$ , $R_{IN-}$			+50	mV
$V_{TL}$	Differential Threshold Low Voltage			-50		mV	
$I_{IN}$	Input Current	$V_{IN} = +2.4V$ , $V_{DD} = 3.6V$				±200	µA
		$V_{IN} = 0V$ , $V_{DD} = 3.6V$				±200	µA

- (1) The Electrical Characteristics tables list guaranteed specifications under the listed Recommended Operating Conditions except as otherwise modified or specified by the Electrical Characteristics Conditions and/or Notes. Typical specifications are estimations only and are not guaranteed.
- (2) Typical values represent most likely parametric norms at  $V_{CC} = 3.3V$ ,  $T_a = +25 \text{ degC}$ , and at the Recommended Operation Conditions at the time of product characterization and are not guaranteed.
- (3) Current into device pins is defined as positive. Current out of a device pin is defined as negative. Voltages are referenced to ground except VOD,  $\Delta VOD$ ,  $V_{TH}$  and  $V_{TL}$  which are differential voltages.
- (4) Specification is guaranteed by characterization and is not tested in production.

## Electrical Characteristics<sup>(1)(2)(3)</sup> (continued)

Over recommended operating supply and temperature ranges unless otherwise specified.

Symbol	Parameter	Conditions	Pin/Freq.	Min	Typ	Max	Units
V <sub>OD</sub>	Output Differential Voltage (D <sub>OUT+</sub> )–(D <sub>OUT-</sub> )	R <sub>L</sub> = 100Ω VODSEL = L (Figure 10)	Tx: D <sub>OUT+</sub> , D <sub>OUT-</sub>	250	400	600	mV
		R <sub>L</sub> = 100Ω VODSEL = H (Figure 10)		450	750	1200	mV
ΔV <sub>OD</sub>	Output Differential Voltage Unbalance	R <sub>L</sub> = 100Ω			4	50	mV
V <sub>OS</sub>	Offset Voltage	R <sub>L</sub> = 100Ω		1.00	1.25	1.50	V
ΔV <sub>OS</sub>	Offset Voltage Unbalance	R <sub>L</sub> = 100Ω			1	50	mV
I <sub>OS</sub>	Output Short Circuit Current	DOUT = 0V, DIN = H, TPWDNB, DEN = 2.4V, VODSEL = L		-2	-5	-8	mA
		DOUT = 0V, DIN = H, TPWDNB, DEN = 2.4V, VODSEL = H	-7	-10	-13	mA	
I <sub>OZ</sub>	TRI-STATE Output Current	TPWDNB, DEN = 0V, DOUT = 0V or 2.4V	-15	±1	+15	μA	
<b>SER/DES SUPPLY CURRENT (DVDD<sup>(5)</sup>, PVDD<sup>(5)</sup> and AVDD<sup>(5)</sup> pins)</b>							
I <sub>DDT</sub>	Serializer (Tx) Total Supply Current (includes load current)	R <sub>L</sub> = 100Ω VODSEL = L Checker-board pattern (Figure 1) <sup>(6)</sup>	f = 40 MHz		40	80	mA
		R <sub>L</sub> = 100Ω VODSEL = H Checker-board pattern (Figure 1) <sup>(6)</sup>	f = 40 MHz		40	85	mA
I <sub>DDTZ</sub>	Serializer (Tx) Supply Current Power-down	TPWDNB = 0V (All other LVCMOS Inputs = 0V)			1	100	μA
I <sub>DDR</sub>	Deserializer (Rx) Total Supply Current (includes load current)	C <sub>L</sub> = 8 pF LVCMOS Output Checker-board pattern (Figure 2) <sup>(6)</sup>	f = 40 MHz			95	mA
		C <sub>L</sub> = 8 pF LVCMOS Output Random pattern	f = 40 MHz			90	mA
I <sub>DDRZ</sub>	Deserializer (Rx) Supply Current Power-down	RPWDNB = 0V (All other LVCMOS Inputs = 0V, R <sub>IN+</sub> /R <sub>IN-</sub> = 0V)			1	50	μA

(5) Digital, PLL, and Analog VDDs

(6) Figure 1, Figure 2, Figure 8, Figure 12, Figure 14 show a falling edge data strobe (TCLK IN/RCLK OUT).

## Serializer Timing Requirements for TCLK

Over recommended operating supply and temperature ranges unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Units
t <sub>TCP</sub>	Transmit Clock Period	Figure 5 <sup>(1)</sup>	25	T	333	ns
t <sub>TClH</sub>	Transmit Clock High Time		0.4T	0.5T	0.6T	ns
t <sub>TClL</sub>	Transmit Clock Low Time		0.4T	0.5T	0.6T	ns
t <sub>CLKT</sub>	TCLK Input Transition Time	Figure 4		3	6	ns
t <sub>JIT</sub>	TCLK Input Jitter	See <sup>(2)</sup>			33	ps (RMS)

(1) Figure 5, Figure 15 show a rising edge data strobe (TCLK IN/RCLK OUT).

(2) t<sub>JIT</sub> (@BER of 10e-9) specifies the allowable jitter on TCLK. t<sub>JIT</sub> not included in TxOUT\_E\_O parameter.

## Serializer Switching Characteristics

Over recommended operating supply and temperature ranges unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Units
$t_{LLHT}$	LVDS Low-to-High Transition Time	$R_L = 100\Omega$ , (Figure 3) $C_L = 10\text{ pF}$ to GND VODSEL = L			0.6	ns
$t_{LHLT}$	LVDS High-to-Low Transition Time				0.6	ns
$t_{DIS}$	DIN (23:0) Setup to TCLK	$R_L = 100\Omega$ , $C_L = 10\text{ pF}$ to GND <sup>(1)</sup>	5			ns
$t_{DIH}$	DIN (23:0) Hold from TCLK		5			ns
$t_{HZD}$	DOOUT ± HIGH to TRI-STATE Delay	$R_L = 100\Omega$ , $C_L = 10\text{ pF}$ to GND (Figure 6) <sup>(2)</sup>			15	ns
$t_{LZD}$	DOOUT ± LOW to TRI-STATE Delay				15	ns
$t_{ZHD}$	DOOUT ± TRI-STATE to HIGH Delay				200	ns
$t_{ZLD}$	DOOUT ± TRI-STATE to LOW Delay				200	ns
$t_{PLD}$	Serializer PLL Lock Time	$R_L = 100\Omega$ , (Figure 7)		10		ms
$t_{SD}$	Serializer Delay	$R_L = 100\Omega$ , (Figure 8) <sup>(3)</sup> VODSEL = L, TRFB = H		3.5T + 2.85	3.5T + 10	ns
		$R_L = 100\Omega$ , (Figure 8) <sup>(3)</sup> VODSEL = L, TRFB = L		3.5T + 2.85	3.5T + 10	ns
TxOUT_E_O	TxOUT_Eye_Opening (respect to ideal)	3–40 MHz (Figure 9) <sup>(4)</sup>		0.68		UI <sup>(5)</sup>

(1) Specification is guaranteed by characterization and is not tested in production.

(2) When the Serializer output is at TRI-STATE, the Deserializer will lose PLL lock. Resynchronization MUST occur before data transfer.

(3) Figure 1, Figure 2, Figure 8, Figure 12, Figure 14 show a falling edge data strobe (TCLK IN/RCLK OUT).

(4)  $t_{JIT}$  (@BER of 10e-9) specifies the allowable jitter on TCLK.  $t_{JIT}$  not included in TxOUT\_E\_O parameter.

(5) UI – Unit Interval, equivalent to one ideal serialized data bit width. The UI scales with frequency.

## Deserializer Switching Characteristics

Over recommended operating supply and temperature ranges unless otherwise specified.

Symbol	Parameter	Conditions	Pin/Freq.	Min	Typ	Max	Units
$t_{RCP}$	Receiver out Clock Period	$t_{RCP} = t_{TCP}$ <sup>(1)</sup>	RCLK	25	T	333	ns
$t_{RDC}$	RCLK Duty Cycle		RCLK	45	50	55	%
$t_{CLH}$	LVC MOS Low-to-High Transition Time	$C_L = 8\text{ pF}$ (lumped load) (Figure 11)	ROUT [23:0], LOCK, RCLK		2.5	3.5	ns
$t_{CHL}$	LVC MOS High-to-Low Transition Time				2.5	3.5	ns
$t_{ROS}$	ROUT (7:0) Setup Data to RCLK (Group 1)	(Figure 15) <sup>(2)</sup>	ROUT [7:0]	(0.40)* $t_{RCP}$	(29/56)* $t_{RCP}$		ns
$t_{ROH}$	ROUT (7:0) Hold Data to RCLK (Group 1)			(0.40)* $t_{RCP}$	(27/56)* $t_{RCP}$		ns
$t_{ROS}$	ROUT (15:8) Setup Data to RCLK (Group 2)	(Figure 15) <sup>(2)</sup>	ROUT [15:8], LOCK	(0.40)* $t_{RCP}$	0.5* $t_{RCP}$		ns

$t_{ROS}$	ROUT (23:16) Setup Data to RCLK (Group 3)	(Figure 15) <sup>(2)</sup>	ROUT [23:16]	(0.40)* $t_{RCP}$	(27/56)* $t_{RCP}$		ns
$t_{ROH}$	ROUT (23:16) Hold Data to RCLK (Group 3)			(0.40)* $t_{RCP}$	(29/56)* $t_{RCP}$		ns
$t_{HZR}$	HIGH to TRI-STATE Delay	(Figure 13)	ROUT [23:0], RCLK, LOCK		3	10	ns
$t_{LZR}$	LOW to TRI-STATE Delay				3	10	ns
$t_{ZHR}$	TRI-STATE to HIGH Delay				3	10	ns
$t_{ZLR}$	TRI-STATE to LOW Delay				3	10	ns
$t_{DD}$	Deserializer Delay	(Figure 12) <sup>(3)</sup>	RCLK		[4+(3/56)]T +5.9	[4+(3/56)]T +18.5	ns

(1) Specification is guaranteed by characterization and is not tested in production.

(2) Figure 5, Figure 15 show a rising edge data strobe (TCLK IN/RCLK OUT).

(3) Figure 1, Figure 2, Figure 8, Figure 12, Figure 14 show a falling edge data strobe (TCLK IN/RCLK OUT).

### Deserializer Switching Characteristics (continued)

Over recommended operating supply and temperature ranges unless otherwise specified.

Symbol	Parameter	Conditions	Pin/Freq.	Min	Typ	Max	Units
$t_{DRDL}$	Deserializer PLL Lock Time from Powerdown <sup>(4)</sup>	(Figure 14) <sup>(3)</sup> (5) (1)	3 MHz		5	50	ms
			40 MHz		5	50	ms
RxIN_TOL_L	Receiver INput TOLerance Left	(Figure 16) (6) (1) (7)	3 MHz–40 MHz			0.25	UI
RxIN_TOL_R	Receiver INput TOLerance Right	(Figure 16) (6) (1) (7)	3 MHz–40 MHz			0.25	UI

- (4)  $t_{DRDL}$  is the time required by the deserializer to obtain lock when exiting powerdown mode.  $t_{DRDL}$  is specified with an external synchronization pattern.
- (5) The Deserializer PLL lock time ( $t_{DRDL}$ ) may vary depending on input data patterns and the number of transitions within the pattern.
- (6) RxIN\_TOL is a measure of how much phase noise (jitter) the deserializer can tolerate in the incoming data stream before bit errors occur. It is a measurement in reference with the ideal bit position, please see AN-1217 (SNLA053) for detail.
- (7) UI – Unit Interval, equivalent to one ideal serialized data bit width. The UI scales with frequency.

## FUNCTIONAL DESCRIPTION

The DS99R101 Serializer and DS99R102 Deserializer chipset is an easy-to-use transmitter and receiver pair that sends 24-bits of parallel LVCMOS data over a single serial LVDS link from 72 Mbps to 960 Mbps throughput. The DS99R101 transforms a 24-bit wide parallel LVCMOS data into a single high speed LVDS serial data stream with embedded clock. The DS99R102 receives the LVDS serial data stream and converts it back into a 24-bit wide parallel data and recovered clock. The 24-bit Serializer/Deserializer chipset is designed to transmit data over shielded twisted pair (STP) at clock speeds from 3 MHz to 40 MHz.

The Deserializer can attain lock to a data stream without the use of a separate reference clock source. The Deserializer synchronizes to the Serializer regardless of data pattern, delivering true automatic “plug and lock” performance. The Deserializer recovers the clock and data by extracting the embedded clock information and validating data integrity from the incoming data stream and then deserializes the data. The Deserializer monitors the incoming clock information, determines lock status, and asserts the LOCK output high when lock occurs. Each has a power down control to enable efficient operation in various applications.

### INITIALIZATION AND LOCKING MECHANISM

Initialization of the DS99R101 and DS99R102 must be established before each device sends or receives data. Initialization refers to synchronizing the Serializer's and Deserializer's PLL's together. After the Serializers locks to the input clock source, the Deserializer synchronizes to the Serializers as the second and final initialization step.

Step 1: When  $V_{DD}$  is applied to both Serializer and/or Deserializer, the respective outputs are held in TRI-STATE and internal circuitry is disabled by on-chip power-on circuitry. When  $V_{DD}$  reaches  $V_{DD}$  OK (2.2V) the PLL in Serializer begins locking to a clock input. For the Serializer, the local clock is the transmit clock, TCLK. The Serializer outputs are held in TRI-STATE while the PLL locks to the TCLK. After locking to TCLK, the Serializer block is now ready to send data patterns. The Deserializer output will remain in TRI-STATE while its PLL locks to the embedded clock information in serial data stream. Also, the Deserializer LOCK output will remain low until its PLL locks to incoming data and sync-pattern on the  $RIN_{\pm}$  pins.

Step 2: The Deserializer PLL acquires lock to a data stream without requiring the Serializer to send special patterns. The Serializer that is generating the stream to the Deserializer will automatically send random (non-repetitive) data patterns during this step of the Initialization State. The Deserializer will lock onto embedded clock within the specified amount of time. An embedded clock and data recovery (CDR) circuit locks to the incoming bit stream to recover the high-speed receive bit clock and re-time incoming data. The CDR circuit expects a coded input bit stream. In order for the Deserializer to lock to a random data stream from the Serializer, it performs a series of operations to identify the rising clock edge and validates data integrity, then locks to it. Because this locking procedure is independent on the data pattern, total random locking duration may vary. At the point when the Deserializer's CDR locks to the embedded clock, the LOCK pin goes high and valid RCLK/data appears on the outputs. Note that the LOCK signal is synchronous to valid data appearing on the outputs. The Deserializer's LOCK pin is a convenient way to ensure data integrity is achieved on receiver side.

### DATA TRANSFER

After lock is established, the Serializer inputs DIN0–DIN23 are used to input data to the Serializer. Data is clocked into the Serializer by the TCLK input. The edge of TCLK used to strobe the data is selectable via the TRFB pin. TRFB high selects the rising edge for clocking data and low selects the falling edge. The Serializer outputs (DOUT $\pm$ ) are intended to drive point-to-point connections or limited multi-point applications.

CLK1, CLK0, DCA, DCB are four overhead bits transmitted along the single LVDS serial data stream. The CLK1 bit is always high and the CLK0 bit is always low. The CLK1 and CLK0 bits function as the embedded clock bits in the serial stream. DCB functions as the DC Balance control bit. It does not require any pre-coding of data on transmit side. The DC Balance bit is used to minimize the short and long-term DC bias on the signal lines. This bit operates by selectively sending the data either unmodified or inverted. The DCA bit is used to validate data integrity in the embedded data stream. Both DCA and DCB coding schemes are integrated and automatically performed within Serializer and Deserializer.

The chipset supports clock frequency ranges of 3 MHz to 40 MHz. Every clock cycle, 24 databits are sent along with 4 additional overhead control bits. Thus the line rate is 1.12 Gbps maximum (84 Mbps minimum). The link is extremely efficient at 86% (24/28). Twenty five (24 data + 1 clock) plus associated ground signals are reduced to only 1 single LVDS pair providing a compression ratio of better than 25 to 1.

Serialized data and clock/control bits (24+4 bits) are transmitted from the serial data output (DOUT±) at 28 times the TCLK frequency. For example, if TCLK is , the serial rate is  $40 \times 28 = 1.12$  Giga bits per second. Since only 24 bits are from input data, the serial “payload” rate is 24 times the TCLK frequency. For instance, if TCLK = 40 MHz, the payload data rate is  $40 \times 24 = 960$  Mbps. TCLK is provided by the data source and must be in the range of 3 MHz to 40 MHz nominal. The Serializer outputs (DOUT±) can drive a point-to-point connection as shown in [Figure 19](#). The outputs transmit data when the enable pin (DEN) is high and TPWDNB is high. The DEN pin may be used to TRI-STATE the outputs when driven low.

When the Deserializer channel attains lock to the input from a Serializer, it drives its LOCK pin high and synchronously delivers valid data and recovered clock on the output. The Deserializer locks onto the embedded clock, uses it to generate multiple internal data strobes, and then drives the recovered clock to the RCLK pin. The recovered clock (RCLK output pin) is synchronous to the data on the ROUT[23:0] pins. While LOCK is high, data on ROUT[23:0] is valid. Otherwise, ROUT[23:0] is invalid. The polarity of the RCLK edge is controlled by the RRFB input. ROUT(0-23), LOCK and RCLK outputs will each drive a maximum of 8 pF load with a 40 MHz clock. REN controls TRI-STATE for ROUTn and the RCLK pin on the Deserializer.

## RESYNCHRONIZATION

If the Deserializer loses lock, it will automatically try to re-establish lock. For example, if the embedded clock edge is not detected one time in succession, the PLL loses lock and the LOCK pin is driven low. The Deserializer then enters the operating mode where it tries to lock to a random data stream. It looks for the embedded clock edge, identifies it and then proceeds through the locking process.

The logic state of the LOCK signal indicates whether the data on ROUT is valid; when it is high, the data is valid. The system must monitor the LOCK pin to determine whether data on the ROUT is valid.

## POWERDOWN

The Powerdown state is a low power sleep mode that the Serializer and Deserializer may use to reduce power when no data is being transferred. The TPWDNB and RPWDNB are used to set each device into power down mode, which reduces supply current to the  $\mu$ A range. The Serializer enters powerdown when the TPWDNB pin is driven low. In powerdown, the PLL stops and the outputs go into TRI-STATE, disabling load current and reducing supply. To exit Powerdown, TPWDNB must be driven high. When the Serializer exits Powerdown, its PLL must lock to TCLK before it is ready for the Initialization state. The system must then allow time for Initialization before data transfer can begin. The Deserializer enters powerdown mode when RPWDNB is driven low. In powerdown mode, the PLL stops and the outputs enter TRI-STATE. To bring the Deserializer block out of the powerdown state, the system drives RPWDNB high.

Both the Serializer and Deserializer must reinitialize and relock before data can be transferred. The Deserializer will initialize and assert LOCK high when it is locked to the encoded clock.

## TRI-STATE

For the Serializer, TRI-STATE is entered when the DEN or TPWDNB pin is driven low. This will TRI-STATE both driver output pins (DOUT+ and DOUT-). When DEN is driven high, the serializer will return to the previous state as long as all other control pins remain static (TPWDNB, TRFB).

When you drive the REN or RPWDNB pin low, the Deserializer enters TRI-STATE. Consequently, the receiver output pins (ROUT0–ROUT23) and RCLK will enter TRI-STATE. The LOCK output remains active, reflecting the state of the PLL. The Deserializer input pins are high impedance during receiver powerdown (RPWDNB low) and power-off ( $V_{DD} = 0V$ ).

## AC-COUPLING AND TERMINATION

The DS99R101 and DS99R102 supports AC-coupled interconnects through integrated DC balanced encoding/decoding scheme. To use AC coupled connection between the Serializer and Deserializer, insert external AC coupling capacitors in series in the LVDS signal path as illustrated in . The Deserializer input stage is designed for AC-coupling by providing a built-in AC bias network which sets the internal  $V_{CM}$  to +1.2V. With AC signal coupling, capacitors provide the ac-coupling path to the signal input.

For the high-speed LVDS transmissions, the smallest available package should be used for the AC coupling capacitor. This will help minimize degradation of signal quality due to package parasitics. The most common used capacitor value for the interface is 100 nF (0.1  $\mu$ F) capacitor.

A termination resistor across  $DOUT_{\pm}$  is also required for proper operation to be obtained. The termination resistor should be equal to the differential impedance of the media being driven. This should be in the range of 90 to 132 Ohms. 100 Ohms is a typical value common used with standard 100 Ohm transmission media. This resistor is required for control of reflections and also to complete the current loop. It should be placed as close to the Serializer  $DOUT_{\pm}$  outputs to minimize the stub length from the pins. To match with the differential impedance on the transmission line, the LVDS I/O are terminated with 100 ohm resistors on Serializer  $DOUT_{\pm}$  outputs pins.

## **PROGRESSIVE TURN-ON (PTO)**

Deserializer  $ROUT[23:0]$  outputs are grouped into three groups of eight, with each group switching about 0.5UI apart in phase to reduce EMI, simultaneous switching noise, and system ground bounce.

## APPLICATIONS INFORMATION

### USING THE DS99R101 AND DS99R102

The DS99R101/DS99R102 Serializer/Deserializer (SERDES) pair sends 24 bits of parallel LVCMOS data over a serial LVDS link up to 960 Mbps. Serialization of the input data is accomplished using an on-board PLL at the Serializer which embeds clock with the data. The Deserializer extracts the clock/control information from the incoming data stream and deserializes the data. The Deserializer monitors the incoming clock information to determine lock status and will indicate lock by asserting the LOCK output high.

### POWER CONSIDERATIONS

An all CMOS design of the Serializer and Deserializer makes them inherently low power devices. Additionally, the constant current source nature of the LVDS outputs minimize the slope of the speed vs.  $I_{DD}$  curve of CMOS designs.

### NOISE MARGIN

The Deserializer noise margin is the amount of input jitter (phase noise) that the Deserializer can tolerate and still reliably recover data. Various environmental and systematic factors include:

Serializer: TCLK jitter,  $V_{DD}$  noise (noise bandwidth and out-of-band noise)

Media: ISI,  $V_{CM}$  noise

Deserializer:  $V_{DD}$  noise

For a graphical representation of noise margin, please see [Figure 16](#).

### TRANSMISSION MEDIA

The Serializer and Deserializer can be used in point-to-point configuration, through a PCB trace, or through twisted pair cable. In a point-to-point configuration, the transmission media needs be terminated at both ends of the transmitter and receiver pair. Interconnect for LVDS typically has a differential impedance of 100 Ohms. Use cables and connectors that have matched differential impedance to minimize impedance discontinuities. In most applications that involve cables, the transmission distance will be determined on data rates involved, acceptable bit error rate and transmission medium.

### LIVE LINK INSERTION

The Serializer and Deserializer devices support live pluggable applications. The “Hot Inserted” operation on the serial interface does not disrupt communication data on the active data lines. The automatic receiver lock to random data “plug & go” live insertion capability allows the DS99R102 to attain lock to the active data stream during a live insertion event.

### PCB LAYOUT AND POWER SYSTEM CONSIDERATIONS

Circuit board layout and stack-up for the LVDS SERDES devices should be designed to provide low-noise power feed to the device. Good layout practice will also separate high frequency or high-level inputs and outputs to minimize unwanted stray noise pickup, feedback and interference. Power system performance may be greatly improved by using thin dielectrics (2 to 4 mils) for power / ground sandwiches. This arrangement provides plane capacitance for the PCB power system with low-inductance parasitics, which has proven especially effective at high frequencies, and makes the value and placement of external bypass capacitors less critical. External bypass capacitors should include both RF ceramic and tantalum electrolytic types. RF capacitors may use values in the range of 0.01 uF to 0.1 uF. Tantalum capacitors may be in the 2.2 uF to 10 uF range. Voltage rating of the tantalum capacitors should be at least 5X the power supply voltage being used.

Surface mount capacitors are recommended due to their smaller parasitics. When using multiple capacitors per supply pin, locate the smaller value closer to the pin. A large bulk capacitor is recommended at the point of power entry. This is typically in the 50uF to 100uF range and will smooth low frequency switching noise. It is recommended to connect power and ground pins directly to the power and ground planes with bypass capacitors connected to the plane with via on both ends of the capacitor. Connecting power or ground pins to an external bypass capacitor will increase the inductance of the path.

A small body size X7R chip capacitor, such as 0603, is recommended for external bypass. Its small body size reduces the parasitic inductance of the capacitor. The user must pay attention to the resonance frequency of these external bypass capacitors, usually in the range of 20-30 MHz range. To provide effective bypassing, multiple capacitors are often used to achieve low impedance between the supply rails over the frequency of interest. At high frequency, it is also a common practice to use two vias from power and ground pins to the planes, reducing the impedance at high frequency.

Some devices provide separate power and ground pins for different portions of the circuit. This is done to isolate switching noise effects between different sections of the circuit. Separate planes on the PCB are typically not required. Pin Description tables typically provide guidance on which circuit blocks are connected to which power pin pairs. In some cases, an external filter may be used to provide clean power to sensitive circuits such as PLLs.

Use at least a four layer board with a power and ground plane. Locate LVCMOS (LVTTTL) signals away from the LVDS lines to prevent coupling from the LVCMOS lines to the LVDS lines. Closely-coupled differential lines of 100 Ohms are typically recommended for LVDS interconnect. The closely coupled lines help to ensure that coupled noise will appear as common-mode and thus is rejected by the receivers. The tightly coupled lines will also radiate less.

Termination of the LVDS interconnect is required. For point-to-point applications, termination should be located at both ends of the devices. Nominal value is 100 Ohms to match the line's differential impedance. Place the resistor as close to the transmitter DOUT $\pm$  outputs and receiver RIN $\pm$  inputs as possible to minimize the resulting stub between the termination resistor and device.

## LVDS INTERCONNECT GUIDELINES

See AN-1108 ([SNLA008](#)) and AN-905 ([SNLA035](#)) for full details.

- Use 100 $\Omega$  coupled differential pairs
- Use the S/2S/3S rule in spacings
  - S = space between the pair
  - 2S = space between pairs
  - 3S = space to LVCMOS/LVTTTL signal
- Minimize the number of VIA
- Use differential connectors when operating above 500Mbps line speed
- Maintain balance of the traces
- Minimize skew within the pair
- Terminate as close to the TX outputs and RX inputs as possible

Additional general guidance can be found in the LVDS Owner's Manual - available in PDF format from the TI web site at: <http://www.ti.com/ww/en/analog/interface/lvds.shtml>

## REVISION HISTORY

<b>Changes from Revision C (April 2013) to Revision D</b>	<b>Page</b>
• Changed layout of National Data Sheet to TI format .....	<a href="#">22</a>

---

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DS99R101VS/NOPB	ACTIVE	TQFP	PFB	48	250	RoHS & Green	SN	Level-3-260C-168 HR	0 to 70	DS99R101 VS	
DS99R102VS/NOPB	ACTIVE	TQFP	PFB	48	250	RoHS & Green	SN	Level-3-260C-168 HR	0 to 70	DS99R102 VS	

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
