

32-pin CK505 for Intel Systems

ICS9LRS4103

Recommended Application:

CK505 clock, 32-pin for 5 series Intel chipsets

Output Features:

- 1 CPU differential low power push-pull pairs
- 1 SRC differential low power push-pull pairs
- 1 Selectable 120MHz CK_SSC_Disp or 100 MHz SRC low power push-pull pair
- 1 SATA/SRC selectable differential low power push-pull pair
- 1 DOT differential low power push-pull pair
- 1 REF, 14.318MHz

Key Specifications:

- CPU outputs cycle-cycle jitter < 85ps
- SRC output cycle-cycle jitter < 125ps
- +/- 100ppm frequency accuracy on all outputs
- SRC are PCle Gen2 compliant

Features/Benefits:

- Supports spread spectrum modulation, default is 0.5% down spread
- Uses external 14.318MHz crystal, external crystal load caps are required for frequency tuning
- Does not require external pass transistor for voltage regulator
- Integrated 33 $\!\Omega$ series resistors on differential outputs, $Zo{=}50\,\Omega$

General Description

ICS9LRS4103 is compatible with the Intel CK505 Yellow Cover specification. This clock synthesizer provides a single chip solution for Intel desktop 5 series chipsets. ICS9LRS4103 is driven with a 14.318MHz crystal. It also provides a tight ppm accuracy output for Serial ATA and PCI-Express support.

Notes on Electrical Characteristics:

¹Guaranteed by design and characterization, not 100% tested in production.

² Slew rate measured through Vswing centered around differential zero

³ Vxabs is defined as the voltage where CLK = CLK#

⁴Only applies to the differential rising edge (CLK rising and CLK# falling)

⁵ Defined as the total variation of all crossing voltages of CLK rising and CLK# falling. Matching applies to rising edge rate of CLK and falling edge of CLK#. It is measured using a +/-75mV window centered on the average cross point where CLK meets CLK#. The average cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations.

⁶ All Long Term Accuracy and Clock Period specifications are guaranteed assuming that REF has been tuned to exactly 14.318180 MHz

⁷ Operation under these conditions is neither implied, nor guaranteed.

⁸ Maximum input voltage is not to exceed maximum VDD

- ICS clock will *acknowledge*
- ICS clock will send the data byte count = X
- ICS clock sends Byte N + X -1
- ICS clock sends Byte 0 through byte X (if X_(H) was written to byte 8).
- · Controller (host) will need to acknowledge each byte
- · Controller (host) will send a not acknowledge bit
- · Controller (host) will send a stop bit

Revision History

Rev.	Issue Date	WHO	Description	Page #
0.1	10/08/08	RDW	Initial Release	-
0.2	11/03/08		Updated Electrical Characterisitcs 1) Updated Idd characteristics for 32-pin parts. Old Idd values were for 56/64 pin devices 2) Updated REF to be 0 ppm – tuned by user with external load caps. It is not +/-300ppm. 3) Minor updates to pagination 4) Added connector dot to SRC output to indicate connection.	Various
0.3	11/05/08	RDW	1) Removed Reference to Wake-On-LAN current spec in data sheet, this part does not support WOL.	
0.4	12/17/08	RDW	SRC Skew from: 500ps to: 200ps	
0.5	04/13/09	RDW	Added top-side marking	
A	03/15/10	RDW	 Updated electrical characteristics per char data Added Table 4: Series Resistor values for REF Corrected SMBus reference to REF strength. REF is 1 load/2load strength. Release to final 	Various
Α	03/15/10	RDW	4. Release to final	\
