## 2. ELECTRICAL SPECIFICATIONS

### (G: Industrial applications, $T_A = -40$ to $+105^\circ\text{C}$ )

In this chapter, shows the electrical specifications of the target products.

Target products (G: Industrial applications):  $T_A = -40$  to  $+105^\circ\text{C}$   
R5F107xxGxx

- Cautions**
- 1. The RL78/I1A has an on-chip debug function, which is provided for development and evaluation. Do not use the on-chip debug function in products designated for mass production, because the guaranteed number of rewritable times of the flash memory may be exceeded when this function is used, and product reliability therefore cannot be guaranteed. Renesas Electronics is not liable for problems occurring when the on-chip debug function is used.**
  - 2. The pins mounted depend on the product. See 2.1 Port Function to 2.2.1 Functions for each product in the RL78/I1A User's Manual.**

## 2.1 Absolute Maximum Ratings

**Absolute Maximum Ratings ( $T_A = 25^\circ\text{C}$ ) (1/2)**

- Notes**
1. Connect the REGC pin to  $V_{SS}$  via a capacitor (0.47 to 1  $\mu\text{F}$ ). This value regulates the absolute maximum rating of the REGC pin. Do not use this pin with voltage applied to it.
  2. Must be 6.5 V or lower.
  3. Do not exceed  $AV_{REF(+)} + 0.3$  V in case of A/D conversion target pin.

**Caution** Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.

- Remarks**
1. Unless specified otherwise, the characteristics of alternate-function pins are the same as those of the port pins.
  2.  $AV_{REF(+)}$ : + side reference voltage of the A/D converter.
  3.  $V_{SS}$ : Reference voltage

**Remark** Unless specified otherwise, the characteristics of alternate-function pins are the same as those of the port pins.

**Caution** Since the CPU is started by the high-speed on-chip oscillator clock after a reset release, check the X1 clock oscillation stabilization time using the oscillation stabilization time counter status register (OSTC) by the user. Determine the oscillation stabilization time of the OSTC register and the oscillation stabilization time select register (OSTS) after sufficiently evaluating the oscillation stabilization time with the resonator to be used.

**Remark** When using the X1 oscillator and XT1 oscillator, see **5.4 System Clock Oscillator** in the **RL78/I1A User's Manual**.

- Notes**
- Value of current at which the device operation is guaranteed even if the current flows from the V<sub>DD</sub> pin to an output pin.
  - However, do not exceed the total current value.
  - Specification under conditions where the duty factor ≤ 70%.  
The output current value that has changed to the duty factor > 70% the duty ratio can be calculated with the following expression (when changing the duty factor from 70% to n%).
    - Total output current of pins = (I<sub>OH</sub> × 0.7)/(n × 0.01)
 <Example> Where n = 80% and I<sub>OH</sub> = -10.0 mA  
 Total output current of pins = (-10.0 × 0.7)/(80 × 0.01) ≅ -8.7 mA  
 However, the current that is allowed to flow into one pin does not vary depending on the duty factor. A current higher than the absolute maximum rating must not flow into one pin.

**Caution** P02, P10 to P12 do not output high level in N-ch open-drain mode.

**Remark** Unless specified otherwise, the characteristics of alternate-function pins are the same as those of the port pins.

2. However, do not exceed the total current value.

3. Specification under conditions where the duty factor  $\leq 70\%$ .

The output current value that has changed to the duty factor  $> 70\%$  the duty ratio can be calculated with the following expression (when changing the duty factor from 70% to n%).

- Total output current of pins =  $(I_{OL} \times 0.7)/(n \times 0.01)$

<Example> Where  $n = 80\%$  and  $I_{OL} = -10.0\text{ mA}$

$$\text{Total output current of pins} = (-10.0 \times 0.7)/(80 \times 0.01) \cong -8.7\text{ mA}$$

### 3. ELECTRICAL SPECIFICATIONS

#### (M: Industrial applications, $T_A = -40$ to $+125^\circ\text{C}$ )

In this chapter, shows the electrical specifications of the target products.

Target products (M: Industrial applications):  $T_A = -40$  to  $+125^\circ\text{C}$   
R5F107xxMxx

- Cautions**
1. The RL78/I1A has an on-chip debug function, which is provided for development and evaluation. Do not use the on-chip debug function in products designated for mass production, because the guaranteed number of rewritable times of the flash memory may be exceeded when this function is used, and product reliability therefore cannot be guaranteed. Renesas Electronics is not liable for problems occurring when the on-chip debug function is used.
  2. The pins mounted depend on the product. See 2.1 Port Function to 2.2.1 Functions for each product in the RL78/I1A User's Manual.
  3. When any of these products are used at  $105^\circ\text{C}$  or lower, see 2. ELECTRICAL SPECIFICATIONS ( $T_A = -40$  to  $+105^\circ\text{C}$ ).

## 3.1 Absolute Maximum Ratings

Absolute Maximum Ratings ( $T_A = 25^\circ\text{C}$ ) (1/2)

Parameter	Symbols	Conditions	Ratings	Unit
Supply voltage	$V_{DD}$		-0.5 to +6.5	V
REGC pin input voltage	$V_{REGC}$	REGC	-0.3 to +2.8 and -0.3 to $V_{DD} + 0.3$ <sup>Note 1</sup>	V
Input voltage	$V_{I1}$	P02, P03, P05, P06, P10 to P12, P20 to P22, P24 to P27, P30, P31, P40, P75 to P77, P120 to P124, P137, P147, P200 to P206, EXCLK, EXCLKS, RESET	-0.3 to $V_{DD} + 0.3$ <sup>Note 2</sup>	V
Output voltage	$V_{O1}$	P02, P03, P05, P06, P10 to P12, P20 to P22, P24 to P27, P30, P31, P40, P75 to P77, P120, P147, P200 to P206	-0.3 to $V_{DD} + 0.3$ <sup>Note 2</sup>	V
Analog input voltage	$V_{AI1}$	ANI0 to ANI2, ANI4 to ANI7, ANI16 to ANI19	-0.3 to $V_{DD} + 0.3$ and -0.3 to $AV_{REF(+)}$ $+ 0.3$ <sup>Notes 2, 3</sup>	V

- Notes**
1. Connect the REGC pin to  $V_{SS}$  via a capacitor (0.47 to 1  $\mu\text{F}$ ). This value regulates the absolute maximum rating of the REGC pin. Do not use this pin with voltage applied to it.
  2. Must be 6.5 V or lower.
  3. Do not exceed  $AV_{REF(+)} + 0.3$  V in case of A/D conversion target pin.

**Caution** Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.

- Remarks**
1. Unless specified otherwise, the characteristics of alternate-function pins are the same as those of the port pins.
  2.  $AV_{REF(+)}$ : + side reference voltage of the A/D converter.
  3.  $V_{SS}$ : Reference voltage

**Caution** Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.

**Remark** Unless specified otherwise, the characteristics of alternate-function pins are the same as those of the port pins.

## 3.2 Oscillator Characteristics

### 3.2.1 X1, XT1 oscillator characteristics

( $T_A = -40$  to  $+125^\circ\text{C}$ ,  $2.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$ ,  $V_{SS} = 0\text{ V}$ )

Parameter	Resonator	Conditions	MIN.	TYP.	MAX.	Unit
X1 clock frequency ( $f_x$ ) <sup>Note</sup>	Ceramic resonator/ crystal resonator		1.0		20.0	MHz
XT1 clock frequency ( $f_{XT}$ ) <sup>Note</sup>	Crystal resonator		32	32.768	35	kHz

**Note** Indicates only permissible oscillator frequency ranges. See **AC Characteristics** for instruction execution time. Request evaluation by the manufacturer of the oscillator circuit mounted on a board to check the oscillator characteristics.

**Caution** Since the CPU is started by the high-speed on-chip oscillator clock after a reset release, check the X1 clock oscillation stabilization time using the oscillation stabilization time counter status register (OSTC) by the user. Determine the oscillation stabilization time of the OSTC register and the oscillation stabilization time select register (OSTS) after sufficiently evaluating the oscillation stabilization time with the resonator to be used.

**Remark** When using the X1 oscillator and XT1 oscillator, see 5.4 System Clock Oscillator in the RL78/I1A User's Manual.

## 3.2.2 On-chip oscillator characteristics

**( $T_A = -40$  to  $+125^\circ\text{C}$ ,  $2.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$ ,  $V_{SS} = 0\text{ V}$ )**

**Notes 1.** Frequency can be selected in a high-speed on-chip oscillator. Selected by bits 0 to 3 of option byte (000C2H/010C2H).

**2.** This indicates the oscillator characteristics only. See **AC Characteristics** for instruction execution time.

**Remark** When using the device at an ambient temperature that exceeds  $T_A = 105^\circ\text{C}$ , the selectable oscillation frequency is 16 MHz max.

**Remark** When using the device at an ambient temperature that exceeds  $T_A = 105^\circ\text{C}$ , only 16 MHz ( $f_{PLL} \times 1/4$ ) can be selected as the CPU operating frequency.

## 3.3 DC Characteristics

## 3.3.1 Pin characteristics

		Total of all pins (When duty $\leq 70\%$ <sup>Note 3</sup> )	$2.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$			-0.4	mA

2. However, do not exceed the total current value.

3. Specification under conditions where the duty factor  $\leq 70\%$ .

The output current value that has changed to the duty factor  $> 70\%$  the duty ratio can be calculated with the following expression (when changing the duty factor from 70% to n%).

- Total output current of pins =  $(I_{OH} \times 0.7)/(n \times 0.01)$

<Example> Where  $n = 80\%$  and  $I_{OH} = -10.0\text{ mA}$

$$\text{Total output current of pins} = (-10.0 \times 0.7)/(80 \times 0.01) \cong -8.7\text{ mA}$$

However, the current that is allowed to flow into one pin does not vary depending on the duty factor.

A current higher than the absolute maximum rating must not flow into one pin.

**Caution** P02, P10 to P12 do not output high level in N-ch open-drain mode.

**Remark** Unless specified otherwise, the characteristics of alternate-function pins are the same as those of the port pins.

## NOTES FOR CMOS DEVICES

- (1) **VOLTAGE APPLICATION WAVEFORM AT INPUT PIN:** Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between VIL (MAX) and VIH (MIN) due to noise, etc., the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between VIL (MAX) and VIH (MIN).
- (2) **HANDLING OF UNUSED INPUT PINS:** Unconnected CMOS device inputs can be cause of malfunction. If an input pin is unconnected, it is possible that an internal input level may be generated due to noise, etc., causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using pull-up or pull-down circuitry. Each unused pin should be connected to VDD or GND via a resistor if there is a possibility that it will be an output pin. All handling related to unused pins must be judged separately for each device and according to related specifications governing the device.
- (3) **PRECAUTION AGAINST ESD:** A strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it when it has occurred. Environmental control must be adequate. When it is dry, a humidifier should be used. It is recommended to avoid using insulators that easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors should be grounded. The operator should be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with mounted semiconductor devices.
- (4) **STATUS BEFORE INITIALIZATION:** Power-on does not necessarily define the initial status of a MOS device. Immediately after the power source is turned ON, devices with reset functions have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. A device is not initialized until the reset signal is received. A reset operation must be executed immediately after power-on for devices with reset functions.
- (5) **POWER ON/OFF SEQUENCE:** In the case of a device that uses different power supplies for the internal operation and external interface, as a rule, switch on the external power supply after switching on the internal power supply. When switching the power supply off, as a rule, switch off the external power supply and then the internal power supply. Use of the reverse power on/off sequences may result in the application of an overvoltage to the internal elements of the device, causing malfunction and degradation of internal elements due to the passage of an abnormal current. The correct power on/off sequence must be judged separately for each device and according to related specifications governing the device.
- (6) **INPUT OF SIGNAL DURING POWER OFF STATE :** Do not input signals or an I/O pull-up power supply while the device is not powered. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Input of signals during the power off state must be judged separately for each device and according to related specifications governing the device.
