

## Features

- ◆ 128K x 36, 256K x 18 memory configurations
- ◆ Supports fast access times:
  - Commercial:
    - 6.5ns up to 133MHz clock frequency (TQFP package only)
  - Commercial and Industrial:
    - 7.5ns up to 117MHz clock frequency
    - 8.0ns up to 100MHz clock frequency
    - 8.5ns up to 87MHz clock frequency
- ◆  $\overline{\text{LBO}}$  input selects interleaved or linear burst mode
- ◆ Self-timed write cycle with global write control ( $\overline{\text{GW}}$ ), byte write enable ( $\overline{\text{BWE}}$ ), and byte writes ( $\overline{\text{BWx}}$ )
- ◆ 3.3V core power supply
- ◆ Power down controlled by ZZ input
- ◆ 3.3V I/O
- ◆ Optional - Boundary Scan JTAG Interface (IEEE 1149.1 compliant)
- ◆ Packaged in a JEDEC Standard 100-pin plastic thin quad flatpack (TQFP), 119 ball grid array (BGA) and 165 fine pitch ball grid array

## Description

The IDT71V3577/79 are high-speed SRAMs organized as 128K x 36/256K x 18. The IDT71V3577/79 SRAMs contain write, data, address and control registers. There are no registers in the data output path (flow-through architecture). Internal logic allows the SRAM to generate a self-timed write based upon a decision which can be left until the end of the write cycle.

The burst mode feature offers the highest level of performance to the system designer, as the IDT71V3577/79 can provide four cycles of data for a single address presented to the SRAM. An internal burst address counter accepts the first cycle address from the processor, initiating the access sequence. The first cycle of output data will flow-through from the array after a clock-to-data access time delay from the rising clock edge of the same cycle. If burst mode operation is selected ( $\overline{\text{ADV}}=\text{LOW}$ ), the subsequent three cycles of output data will be available to the user on the next three rising clock edges. The order of these three addresses are defined by the internal burst counter and the  $\overline{\text{LBO}}$  input pin.

The IDT71V3577/79 SRAMs utilize IDT's latest high-performance CMOS process and are packaged in a JEDEC standard 14mm x 20mm 100-pin thin plastic quad flatpack (TQFP) as well as a 119 ball grid array (BGA) and a 165 fine pitch ball grid array (fBGA).

## Pin Definitions<sup>(1)</sup>

Symbol	Pin Function	I/O	Active	Description
A0-A17	Address Inputs	I	N/A	Synchronous Address inputs. The address register is triggered by a combination of the rising edge of CLK and $\overline{ADSC}$ Low or $\overline{ADSP}$ Low and $\overline{CE}$ Low.
$\overline{ADSC}$	Address Status (Cache Controller)	I	LOW	Synchronous Address Status from Cache Controller. $\overline{ADSC}$ is an active LOW input that is used to load the address registers with new addresses.
$\overline{ADSP}$	Address Status (Processor)	I	LOW	Synchronous Address Status from Processor. $\overline{ADSP}$ is an active LOW input that is used to load the address registers with new addresses. $\overline{ADSP}$ is gated by $\overline{CE}$ .
$\overline{ADV}$	Burst Address Advance	I	LOW	Synchronous Address Advance. $\overline{ADV}$ is an active LOW input that is used to advance the internal burst counter, controlling burst access after the initial address is loaded. When the input is HIGH the burst counter is not incremented; that is, there is no address advance.
$\overline{BWE}$	Byte Write Enable	I	LOW	Synchronous byte write enable gates the byte write inputs $\overline{BW1}$ - $\overline{BW4}$ . If $\overline{BWE}$ is LOW at the rising edge of CLK then $\overline{BWx}$ inputs are passed to the next stage in the circuit. If $\overline{BWE}$ is HIGH then the byte write inputs are blocked and only $\overline{GW}$ can initiate a write cycle.
$\overline{BW1}$ - $\overline{BW4}$	Individual Byte Write Enables	I	LOW	Synchronous byte write enables. $\overline{BW1}$ controls I/O0-7, I/OP1, $\overline{BW2}$ controls I/O8-15, I/OP2, etc. Any active byte write causes all outputs to be disabled.
$\overline{CE}$	Chip Enable	I	LOW	Synchronous chip enable. $\overline{CE}$ is used with $CS0$ and $\overline{CS1}$ to enable the IDT71V3577/79. $\overline{CE}$ also gates $\overline{ADSP}$ .
CLK	Clock	I	N/A	This is the clock input. All timing references for the device are made with respect to this input.
$CS0$	Chip Select 0	I	HIGH	Synchronous active HIGH chip select. $CS0$ is used with $\overline{CE}$ and $\overline{CS1}$ to enable the chip.
$\overline{CS1}$	Chip Select 1	I	LOW	Synchronous active LOW chip select. $\overline{CS1}$ is used with $\overline{CE}$ and $CS0$ to enable the chip.
$\overline{GW}$	Global Write Enable	I	LOW	Synchronous global write enable. This input will write all four 9-bit data bytes when LOW on the rising edge of CLK. $\overline{GW}$ supersedes individual byte write enables.
I/O0-I/O31 I/OP1-I/OP4	Data Input/Output	I/O	N/A	Synchronous data input/output (I/O) pins. The data input path is registered, triggered by the rising edge of CLK. The data output path is flow-through (no output register).
$\overline{LBO}$	Linear Burst Order	I	LOW	Asynchronous burst order selection input. When $\overline{LBO}$ is HIGH, the inter-leaved burst sequence is selected. When $\overline{LBO}$ is LOW the Linear burst sequence is selected. $\overline{LBO}$ is a static input and must not change state while the device is operating.
$\overline{OE}$	Output Enable	I	LOW	Asynchronous output enable. When $\overline{OE}$ is LOW the data output drivers are enabled on the I/O pins if the chip is also selected. When $\overline{OE}$ is HIGH the I/O pins are in a high-impedance state.
TMS	Test ModeSelect	I	N/A	Gives input command for TAP controller. Sampled on rising edge of TDK. This pin has an internal pullup.
TDI	Test Data Input	I	N/A	Serial input of registers placed between TDI and TDO. Sampled on rising edge of TCK. This pin has an internal pullup.
TCK	Test Clock	I	N/A	Clock input of TAP controller. Each TAP event is clocked. Test inputs are captured on rising edge of TCK, while test outputs are driven from the falling edge of TCK. This pin has an internal pullup.
TDO	Test DataOutput	O	N/A	Serial output of registers placed between TDI and TDO. This output is active depending on the state of the TAP controller.
$\overline{TRST}$	JTAG Reset (Optional)	I	LOW	Optional Asynchronous JTAG reset. Can be used to reset the TAP controller, but not required. JTAG reset occurs automatically at power up and also resets using TMS and TCK per IEEE 1149.1. If not used $\overline{TRST}$ can be left floating. This pin has an internal pullup. Only available in BGA package.
ZZ	Sleep Mode	I	HIGH	Asynchronous sleep mode input. ZZ HIGH will gate the CLK internally and power down the IDT71V3577/79 to its lowest power consumption level. Data retention is guaranteed in Sleep Mode. This pin has an internal pull down.
VDD	Power Supply	N/A	N/A	3.3V core power supply.
VDDO	Power Supply	N/A	N/A	3.3V I/O Supply.
VSS	Ground	N/A	N/A	Ground.
NC	No Connect	N/A	N/A	NC pins are not electrically connected to the device.

### NOTE:

1. All synchronous inputs must meet specified setup and hold times with respect to CLK.

### NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- V<sub>DD</sub> terminals only.
- V<sub>DDQ</sub> terminals only.
- Input terminals only.
- I/O terminals only.
- This is a steady-state DC parameter that applies after the power supplies have ramped up. Power supply sequencing is not necessary; however, the voltage on any input or I/O pin cannot exceed V<sub>DDQ</sub> during power supply ramp up.
- T<sub>A</sub> is the "instant on" case temperature.

2. Transition is measured ±200mV from steady-state.
3. Device must be deselected when powered-up from sleep mode.
4. t<sub>CFG</sub> is the minimum time required to configure the device based on the  $\overline{\text{LBO}}$  input.  $\overline{\text{LBO}}$  is a static input and must not change during normal operation.
5. 6.5ns speed only available in TQFP package and in commercial temp range.

## Timing Waveform of Flow-Through Read Cycle <sup>(1,2)</sup>

6450 drw.06

**NOTES:**

1. O1 (Ax) represents the first output from the external address Ax. O1 (Ay) represents the first output from the external address Ay; O2 (Ay) represents the next output data in the burst sequence of the base address Ay, etc. where A0 and A1 are advancing for the four word burst in the sequence defined by the state of the LBO input.
2. ZZ input is LOW and LBO is Don't Care for this cycle.
3. CS0 timing transitions are identical but inverted to the  $\overline{CE}$  and  $\overline{CS1}$  signals. For example, when  $\overline{CE}$  and  $\overline{CS1}$  are LOW on this waveform, CS0 is HIGH.

# Timing Waveform of Combined Flow-Through Read and Write Cycles (1,2,3)

6450 dtw 07

**NOTES:**

1. Device is selected through entire cycle;  $\overline{CE}$  and  $\overline{CS_1}$  are LOW,  $\overline{CS_0}$  is HIGH.
2. Zz input is LOW and LBO is Don't Care for this cycle.
3. O1 (Ax) represents the first output from the external address Ax. I1 (Ay) represents the first input from the external address Ay. O1 (Az) represents the first output from the external address Az. O2 (Az) represents the next output data in the burst sequence of the base address Az, etc. where A0 and A1 are advancing for the four word burst in the sequence defined by the state of the LBO input.

### Timing Waveform of Write Cycle No. 1 - **GW** Controlled (1,2,3)

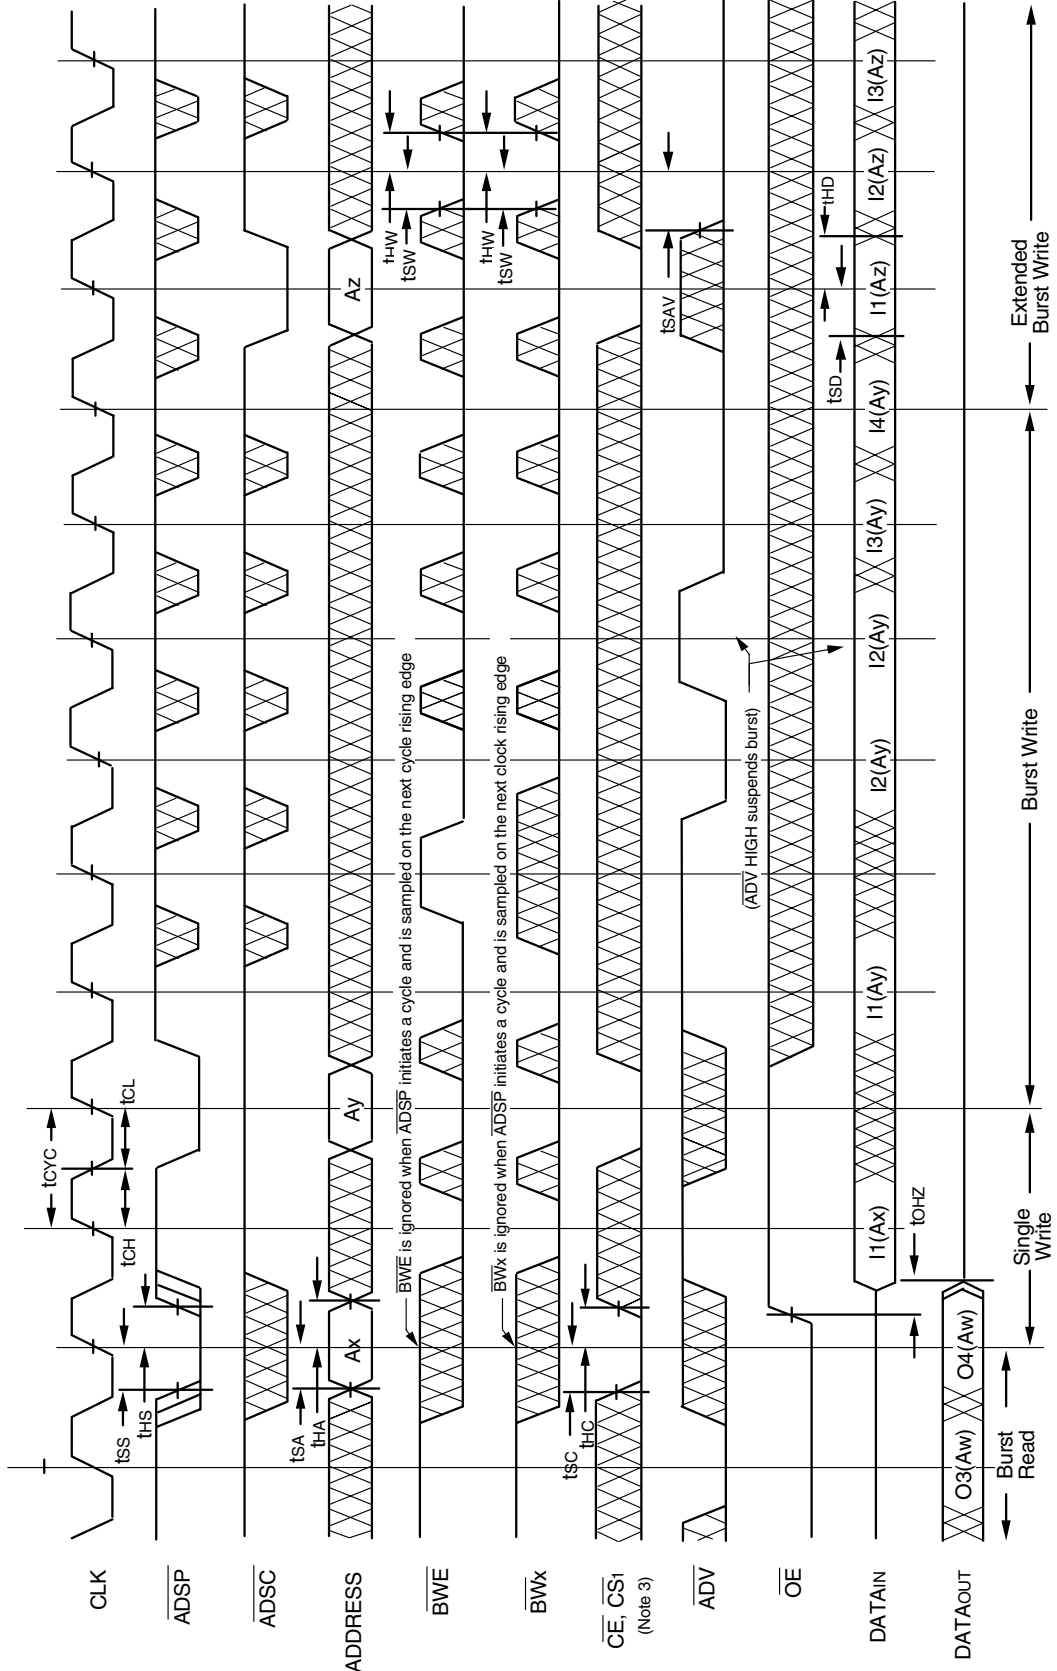

6450 drw 08

**NOTES:**

1. Z<sub>Z</sub> input is LOW,  $\overline{BWE}$  is HIGH and  $\overline{LBO}$  is Don't Care for this cycle.
2. O4 (Aw) represents the final output data in the burst sequence of the base address Aw. I1 (Ax) represents the first input from the external address Ax. I1 (Ay) represents the first input from the external address Ay. I2 (Ay) represents the next input data in the burst sequence of the base address Ay, etc. where A0 and A1 are advancing for the four word burst in the sequence defined by the state of the LBO input. In the case of input I2 (Ay) this data is valid for two cycles because ADV is high and has suspended the burst.
3. CS0 timing transitions are identical but inverted to the  $\overline{CE}$  and  $\overline{CS1}$  signals. For example, when  $\overline{CE}$  and  $\overline{CS1}$  are LOW on this waveform, CS0 is HIGH.

Timing Waveform of Write Cycle No. 2 - Byte Controlled (1,2,3)

6450 dnw.09

NOTES:

1. ZZ input is LOW,  $\overline{GW}$  is HIGH and  $\overline{LBO}$  is Don't Care for this cycle.
2. O4 (Aw) represents the final output data in the burst sequence of the base address Aw. I1 (Ax) represents the first input from the external address Ay; I2 (Ay) represents the next input data in the burst sequence of the base address Ay, etc. where A0 and A1 are advancing for the four word burst in the sequence defined by the state of the LBO input. In the case of input I2 (Ay) this data is valid for two cycles because ADV is high and has suspended the burst.
3. CS0 timing transitions are identical but inverted to the  $\overline{CE}$  and  $\overline{CS1}$  signals. For example, when  $\overline{CE}$  and  $\overline{CS1}$  are LOW on this waveform, CS0 is HIGH.

### Timing Waveform of Sleep (ZZ) and Power-Down Modes (1,2,3)

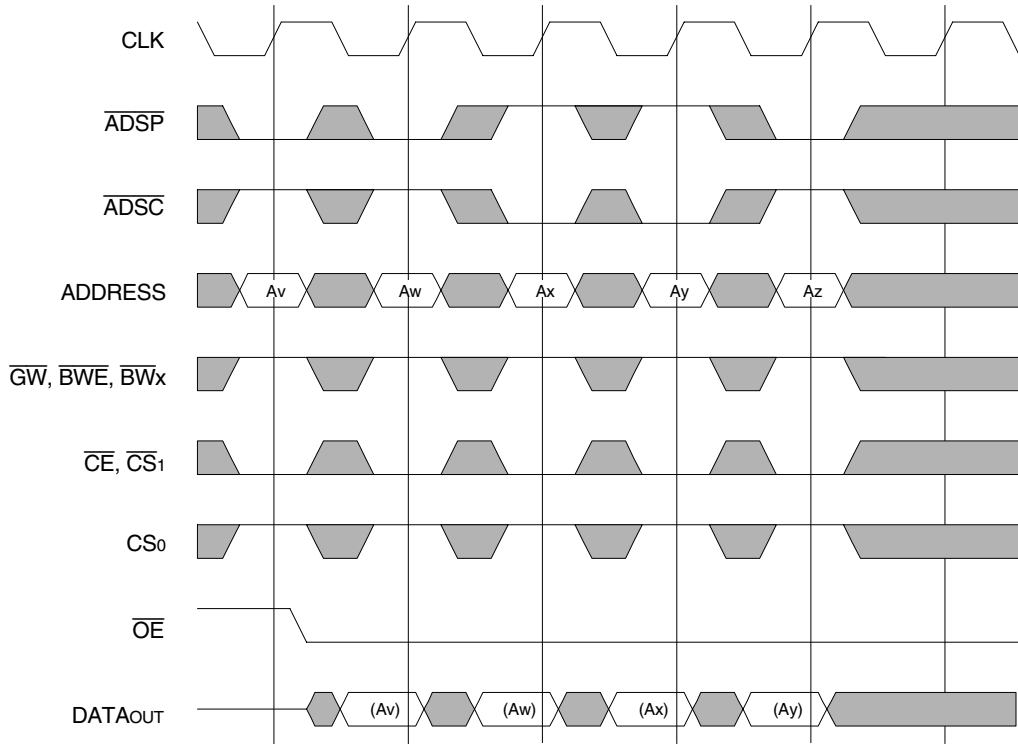

6450 drw 13

**NOTES:**

1. Device must power up in deselected Mode.
2. LBO is Don't Care for this cycle.
3. It is not necessary to retain the state of the input registers throughout the Power-down cycle.
4. CS0 timing transitions are identical but inverted to the OE and CS1 signals. For example, when CE and CS1 are LOW on this waveform, CS0 is HIGH.

## Non-Burst Read Cycle Timing Waveform

**NOTES:**

1. ZZ input is LOW,  $\overline{ADV}$  is HIGH and  $\overline{LBO}$  is Don't Care for this cycle.
2. (Ax) represents the data for address Ax, etc.
3. For read cycles,  $\overline{ADSP}$  and  $\overline{ADSC}$  function identically and are therefore interchangeable.

6450 drw 10

## Non-Burst Write Cycle Timing Waveform

**NOTES:**

1. ZZ input is LOW,  $\overline{ADV}$  and  $\overline{OE}$  are HIGH, and  $\overline{LBO}$  is Don't Care for this cycle.
2. (Ax) represents the data for address Ax, etc.
3. Although only  $\overline{GW}$  writes are shown, the functionality of  $\overline{BWE}$  and  $\overline{BWx}$  together is the same as  $\overline{GW}$ .
4. For write cycles,  $\overline{ADSP}$  and  $\overline{ADSC}$  have different limitations.

6450 drw 11

## JTAG Interface Specification (SA Version only)

**NOTES:**

1. Device inputs = All device inputs except TDI, TMS and  $\overline{TRST}$ .
2. Device outputs = All device outputs except TDO.
3. During power up,  $\overline{TRST}$  could be driven low or not be used since the JTAG circuit resets automatically.  $\overline{TRST}$  is an optional JTAG reset.

**NOTES:**

1. Guaranteed by design.
2. AC Test Load (Fig. 1) on external output signals.
3. Refer to AC Test Conditions stated earlier in this document.
4. JTAG operations occur at one speed (10MHz). The base device may run at any speed specified in this datasheet.

## Scan Register Sizes

Register Name	Bit Size
Instruction (IR)	4
Bypass (BYR)	1
JTAG Identification (JIDR)	32
Boundary Scan (BSR)	Note (1)

l6450 tbl 03

**NOTE:**

1. The Boundary Scan Descriptive Language (BSDL) file for this device is available by contacting your local IDT sales representative.

## JTAG Identification Register Definitions (SA Version only)

Instruction Field	Value	Description
Revision Number (31:28)	0x2	Reserved for version number.
IDT Device ID (27:12)	0x22C, 0x22E	Defines IDT part number 71V3577YSA and 71V3579YSA, respectively.
IDT JEDEC ID (11:1)	0x33	Allows unique identification of device vendor as IDT.
ID Register Indicator Bit (Bit 0)	1	Indicates the presence of an ID register.

I6450 tbl 02

## Available JTAG Instructions

Instruction	Description	OPCODE
EXTEST	Forces contents of the boundary scan cells onto the device outputs <sup>(1)</sup> . Places the boundary scan register (BSR) between TDI and TDO.	0000
SAMPLE/PRELOAD	Places the boundary scan register (BSR) between TDI and TDO. SAMPLE allows data from device inputs <sup>(2)</sup> and outputs <sup>(1)</sup> to be captured in the boundary scan cells and shifted serially through TDO. PRELOAD allows data to be input serially into the boundary scan cells via the TDI.	0001
DEVICE_ID	Loads the JTAG ID register (JIDR) with the vendor ID code and places the register between TDI and TDO.	0010
HIGHZ	Places the bypass register (BYR) between TDI and TDO. Forces all device output drivers to a High-Z state.	0011
RESERVED	Several combinations are reserved. Do not use codes other than those identified for EXTEST, SAMPLE/PRELOAD, DEVICE_ID, HIGHZ, CLAMP, VALIDATE and BYPASS instructions.	0100
RESERVED		0101
RESERVED		0110
RESERVED		0111
CLAMP	Uses BYR. Forces contents of the boundary scan cells onto the device outputs. Places the bypass register (BYR) between TDI and TDO.	1000
RESERVED	Same as above.	1001
RESERVED		1010
RESERVED		1011
RESERVED		1100
VALIDATE	Automatically loaded into the instruction register whenever the TAP controller passes through the CAPTURE-IR state. The lower two bits '01' are mandated by the IEEE std. 1149.1 specification.	1101
RESERVED	Same as above.	1110
BYPASS	The BYPASS instruction is used to truncate the boundary scan register as a single bit in length.	1111

## Datasheet Document History

01/30/04		Released Y generation die step datasheet
04/17/06	Pg. 21	Added green (Restricted hazardous substance device) to the datasheet.
04/02/12	Pg. 9	Added Industrial temp range values to the 7.5ns speed in the DC chars table
	Pg. 21	Removed die step indicator from the ordering information. Added tape and reel and green to the ordering information. Removed IDT from the ordering information.
	Pg. 1, 12 & 21	Added 6.5ns speed only available in TQFP package and in commercial temp range.
