

## Very low offset single bipolar operational amplifier

### Features

- Extremely low offset: 150 $\mu$ V/ max.
- Low input bias current: 1.8nA
- LOW  $V_{io}$  drift: 0.5 $\mu$ V/ $^{\circ}$ C
- Ultra stable with time: 2 $\mu$ V/month max.
- Wide supply voltage range:  $\pm$ 3V to  $\pm$  22V
- Temperature range: 0 $^{\circ}$ C to -105 $^{\circ}$ C

### Description

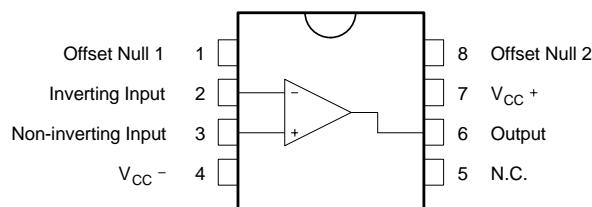

The OP07 is a very high precision op-amp with an offset voltage maximum of 150 $\mu$ V.

Offering also low input current (1.8nA) and high gain (400V/mV), the OP07 is particularly suitable for instrumentation applications.

1. Short-circuits can cause excessive heating and destructive dissipation.
2.  $R_{th}$  are typical values.
3. Human body model: 100pF discharged through a 1.5kΩ resistor between two pins of the device, done for all couples of pin combinations with other pins floating.
4. Machine model: a 200pF cap is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5Ω). Done for all couples of pin combinations with other pins floating.
5. Charged device model: all pins plus package are charged together to the specified voltage and then discharged directly to the ground.
