

2.5MHz, Over-The-Top Low Power, Rail-to-Rail Input and Output Op Amp in SOT-23 **DESCRIPTION**

FEATURES

- Operates with Inputs Above V⁺
- Rail-to-Rail Input and Output
- Gain Bandwidth Product: 2.5MHz
- Slew Rate: 2.1V/µs
- Low Input Offset Voltage: 3.5mV Max
- High Voltage Gain: 1000V/mV
- Single Supply Input Range: 0V to 18V
- Specified on 3V, 5V and ±5V Supplies
- Reverse Battery Protection to 18V
- Low Power: 750µA Supply Current Max
- Output Shutdown on 6-Lead Version
- High Output Current: 15mA Min
- Operating Temperature Range: –40°C to 85°C
- Low Profile (1mm) ThinSOT[™] Package

APPLICATIONS

- Portable Instrumentation
- Battery-Powered Systems
- Sensor Conditioning
- Supply Current Sensing
- MUX Amplifiers
- 4mA to 20mA Transmitters

The LT[®]1784 is a 2.5MHz op amp available in the small SOT-23 package that operates on all single and split supplies with a total voltage of 2.5V to 18V. The amplifier draws less than 750 μ A of quiescent current and has reverse battery protection, drawing negligible current for reverse supply voltages up to 18V.

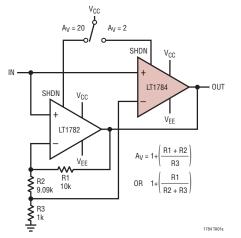

The input range of the LT1784 includes ground, and a unique feature of this device is its Over-The-Top® operation capabilitity with either or both of its inputs above the positive rail. The inputs handle 18V both differential and common mode, independent of supply voltage. The input stage incorporates phase reversal protection to prevent false outputs from occurring even when the inputs are 9V below the negative supply.

The LT1784 can drive loads up to 15mA and still maintain rail-to-rail capability. A shutdown feature on the 6-lead version can disable the part, making the output high impedance and reducing quiescent current to 5 μ A. The LT1784 op amp is available in the 5- and 6-lead SOT-23 packages. For applications requiring lower power, refer to the LT1782 and LT1783 data sheets.

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Note 2: A heat sink may be required to keep the junction temperature below absolute maximum.

Note 3: $V_S = 5V$ limits are guaranteed by correlation to $V_S = 3V$ and $V_S = \pm 5V$ or $V_S = \pm 9V$ tests.

Note 4: $V_S = 3V$ limits are guaranteed by correlation to $V_S = 5V$ and $V_S = \pm 5V$ or $V_S = \pm 9V$ tests.

Note 5: Guaranteed by correlation to slew rate at $V_S = \pm 5V$, and GBW at $V_S = 5V$ and $V_S = \pm 5V$ tests.

Note 6: This specification implies a typical input offset voltage of 5.7mV at V_{CM} = 18V and a maximum input offset voltage of 18mV at V_{CM} = 18V. Note 7: This parameter is not 100% tested.

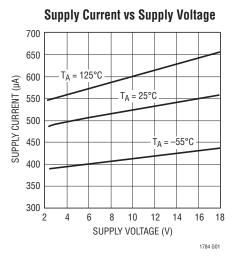

Note 8: Specifications apply to 6-lead SOT-23 with shutdown.

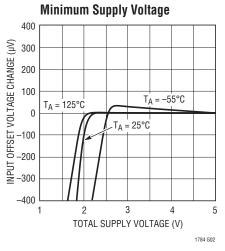

Note 9: Full-power bandwidth is calculated from the slew rate. FPBW = $SR/2\pi V_P$.

Note 10: The LT1784C is guaranteed functional over the operating temperature range -40°C to 85°C.

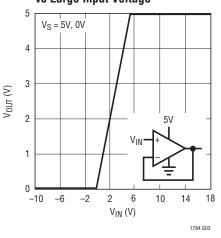

Note 11: The LT1784C is guaranteed to meet specified performance from 0°C to 70°C. The LT1784C is designed, characterized and expected to meet specified performance from -40°C to 85°C but is not tested or QA sampled at these temperatures. LT1784I is guaranteed to meet specified performance from -40°C to 85°C.

APPLICATIONS INFORMATION

Supply Voltage

The positive supply pin of the LT1784 should be bypassed with a small capacitor (typically 0.1μ F) within an inch of the pin. When driving heavy loads, and additional 4.7μ F electrolytic capacitor should be used. When using split supplies the same is true for the negative supply pin.

The LT1784 is protected against reverse battery voltages up to 18V. In the event a reverse battery condition occurs the supply current is less than 1nA.

Inputs

The LT1784 has two input stages, NPN and PNP (see the Simplified Schematic), resulting in three distinct operating regions as shown in the "Input Bias Current vs Common Mode" Typical Performance Characteristic curve.

For input voltages about 1V or more below V⁺, the PNP input stage is active and the input bias current is typically -250nA. When the input common mode voltage is within 0.6V of the positive rail, the NPN stage is operating and the input bias current is typically 500nA. Increases in temperature will cause the voltage at which operation switches from the PNP input stage to the NPN input stage to move towards V⁺. The input offset voltage of the NPN stage is untrimmed and is typically 3mV.

A Schottky diode in the collector of the input transistors, along with special geometries for these NPN transistors, allow the LT1784 to operate with either or both of its inputs above V⁺. At about 0.3V above V⁺, the NPN input transistors is fully saturated and the input bias current is typically 200µA at room temperature. The input offset voltage is typically 3mV when operating above V⁺. The LT1784 will operate with inputs 18V above V⁻ regardless of V⁺.

The inputs are protected against excursions as much as 10V below V⁻ by an internal 1k resistor in series with each input and a diode from the input to the negative supply. The input stage of the LT1784 incorporates phase reversal protection to prevent the output from phase reversing for inputs up to 9V below V⁻. There are no clamping diodes between the inputs and the maximum differential input voltage is 18V.

Output

The output of the LT1784 can swing to within 80mV of the positive rail and within 4mV of the negative rail with no load. When monitoring input voltages within 80mV of the positive rail or within 4mV of the negative rail, gain should be taken to keep the output from clipping. The LT1784 can typically sink and source over 25mA at ±5V supplies, sourcing current is reduced to 7.5mA at 3V total supplies as noted in the Electrical Characteristics section.

The LT1784 is internally compensated to drive at least 400pF of capacitance under any output loading conditions. A 0.22μ F capacitor in series with a 150Ω resistor between the output and ground will compensate these amplifiers for larger capacitive loads, up to 10,000pF at all output currents.

Distortion

There are two main contributors to distortion in op amps: output crossover distortion as the output transitions from sourcing to sinking current, and distortion caused by nonlinear common mode rejection. If the op amp is operating inverting, there is no common mode induced distortion. If the op amp is operating in the PNP input stage (input not within 1V of V⁺), the CMRR is very good, typically 95dB. When the LT1784 switches between input stages, there is significant nonlinearity in the CMRR. Lower load resistance increases the output crossover distortion but has no effect on the input stage transition distortion. For lowest distortion, the LT1784 should be operated single supply, with the output always sourcing current and with the input voltage swing between ground and $(V^+ - 1V)$. See Typical Performance Characteristics curve, "Total Harmonic Distortion + Noise vs Output Voltage Amplitude."

Gain

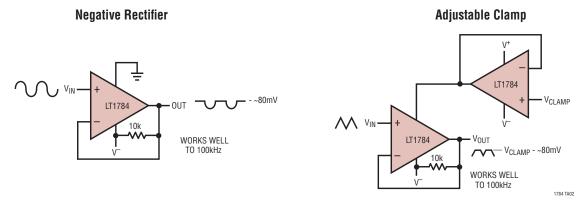

The open-loop gain is almost independent of load when the output is sourcing current. This optimizes performance in single supply applications where the load is returned to ground. The Typical Performance Characteric curve "Open-Loop Gain" for various loads shows the details.

APPLICATIONS INFORMATION

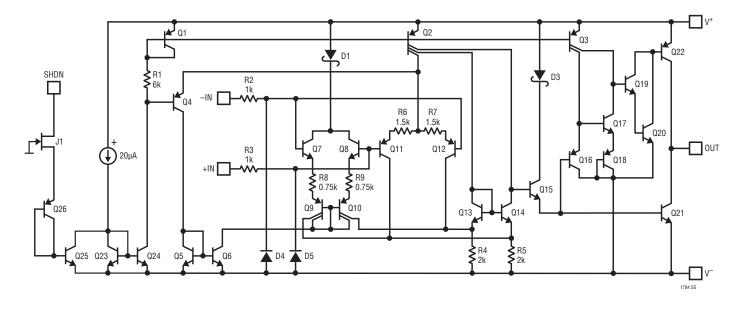

Shutdown

The 6-lead part includes a shutdown feature that disables the part, reducing quiescent current and making the output high impedance. The part can be shut down by bringing

TYPICAL APPLICATIONS

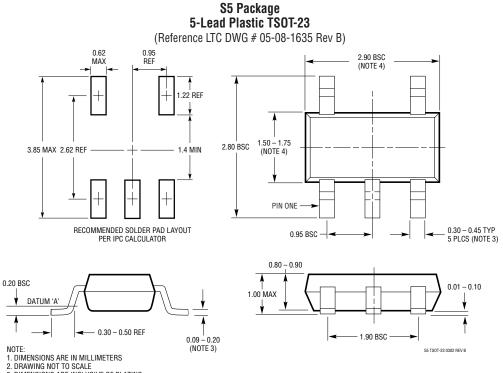

SIMPLIFIED SCHEMATIC

the SHDN pin 1.2V or more above V⁻. When shut down, the supply current is less than 1µA (V⁻ \leq V_{OUT} \leq V⁺). In normal operation, the SHDN pin can be tied to V⁻ or left floating. See Typical Performance Characteristics curve, "Supply Current vs SHDN pin Voltage."
