Note:

(1) PC13, PC14 and PC15 are powered through the power switch. Since the switch only sinks limited current (3mA), the use of GPIO from PC13 to PC15 in output mode is limited:

- ① The speed shall not exceed 2MHz when the heavy load is 30pF;
- ② Not used for current source (e.g. driving LED).

(2) For Pin 5 and Pin 6 of LQFP64 and LQFP48 package, the default configuration after the chip is reset is OSC_IN and OSC_OUT, the software can reset these two pins with PD0 and PD1 functions; for LQFP100 package, PD0 and PD1 are inherent function pins.

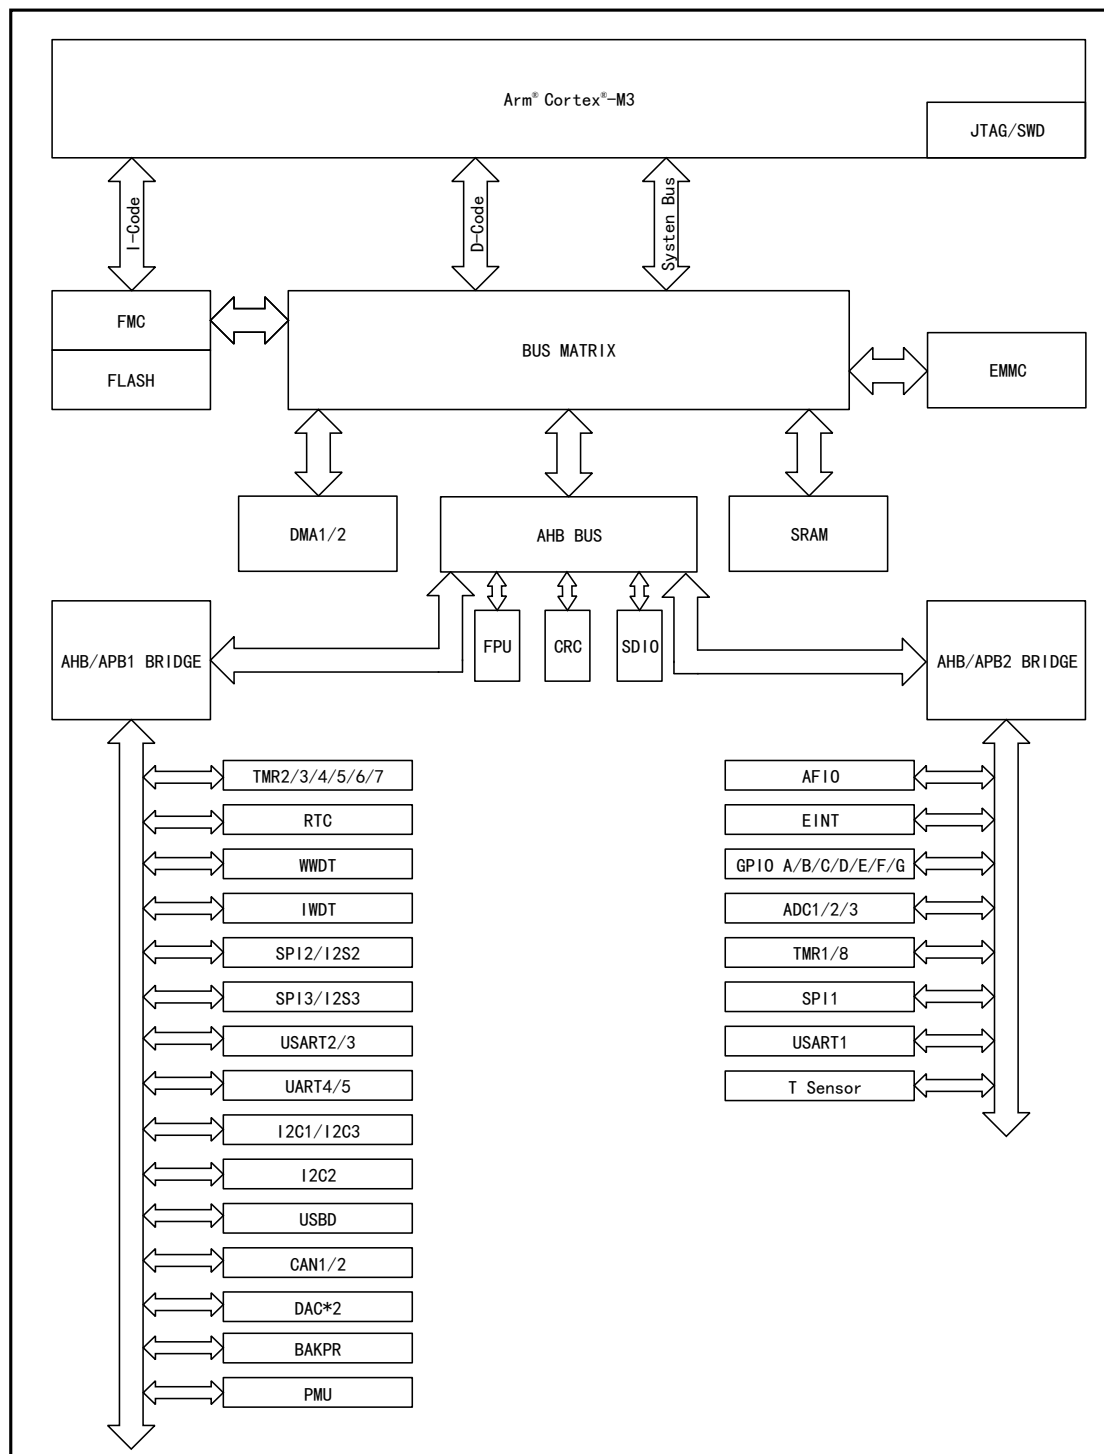

4. Functional description

This chapter mainly introduces the system architecture, interrupt, on-chip memory, clock, power supply and peripheral features of APM32E103xCxE series products; for information about the Arm® Cortex®-M3 core, please refer to the Arm® Cortex®-M3 technical reference manual, which can be downloaded from ARM's website.

4.1. System architecture

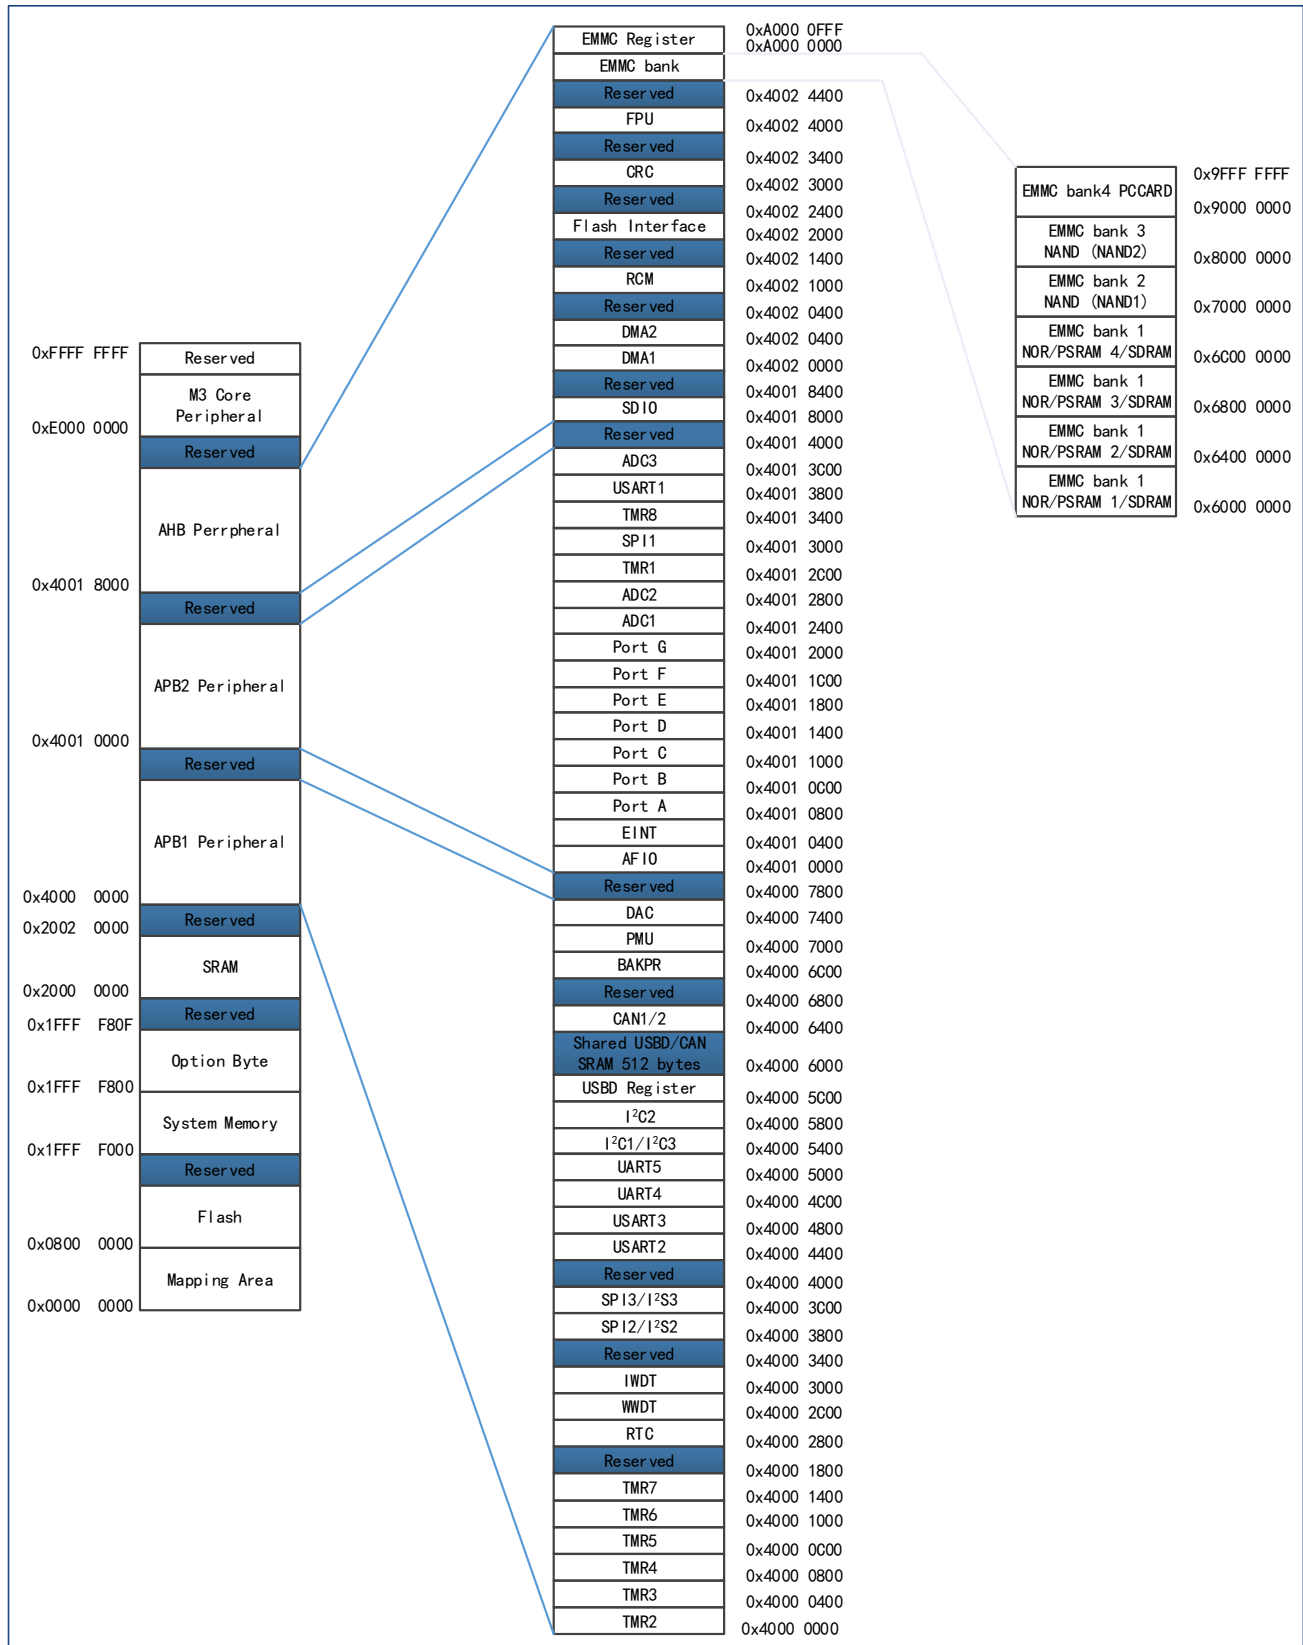

4.1.1. System block diagram

Figure 6APM32E103xCxE System Block Diagram

4.1.2. Address mapping

Figure 7 APM32E103xCxE Series Address Mapping Diagram

4.1.3. Startup configuration

At startup, the user can select one of the following three startup modes by setting the high and low levels of the Boot pin:

- Startup from main memory
- Startup from BootLoader
- Startup from built-in SRAM

The user can use USART interface to reprogram the user Flash if boot from BootLoader.

4.2. Core

The core of APM32E103xCxE is Arm® Cortex®-M3. Based on this platform, the development cost is low and the power consumption is low. It can provide excellent computing performance and advanced system interrupt response, and is compatible with all ARM tools and software.

4.3. Interrupt controller

4.3.1. Nested Vector Interrupt Controller (NVIC)

It embeds a nested vectored interrupt controller (NVIC) that can handle up to 65 maskable interrupt channels (not including 16 interrupt lines of Cortex®-M3) and 16 priority levels. The interrupt vector entry address can be directly transmitted to the core, so that the interrupt response processing with low delay can give priority to the late higher priority interrupt.

4.3.2. External Interrupt/Event Controller (EINT)

The external interrupt/event controller consists of 19 edge detectors, and each detector includes edge detection circuit and interrupt/event request generation circuit; each detector can be configured as rising edge trigger, falling edge trigger or both and can be masked independently. Up to 112 GPIOs can be connected to the 16 external interrupt lines.

4.4. On-chip memory

On-chip memory includes main memory area, SRAM and information block; the information block includes system memory area and option byte; the system memory area stores BootLoader, 96-bit unique device ID and capacity information of main memory area; the system memory area has been written into the program and cannot be erased.

Table4 On-chip Memory Area

| Memory | Maximum capacity | Function |
|--------------------|------------------|--|
| Main memory area | 512 KB | Store user programs and data. |
| SRAM | 128 KB | CPU can access at 0 waiting cycle (read/write). |

4.4.2. LCD parallel interface

EMMC can be configured to the seamless connection with most graphic LCD controller, it supports the Intel 8080 and Motorola 6800 model, and can be flexibly with specific LCD interface. Using the parallel interface LCD can be easily build simple graphics applications, or use a special scheme of high performance speed controller.

4.5. Clock

Clock tree of APM32E103xCxE is shown in the figure below:

Figure 8 APM32E103xCxE Clock Tree

4.5.1. Clock source

Clock source is divided into high-speed clock and low-speed clock according to the speed; the high-speed clock includes HSI1CLK and HSECLK, and the low-speed clock includes LSECLK and LSI1CLK; clock source is divided into internal clock and external clock according to the chip inside/outside; the internal clock includes HSI1CLK and LSI1CLK, and the external clock includes HSECLK and LSECLK, among which HSI1CLK is calibrated by the factory to $\pm 1\%$ accuracy.

4.5.2. System clock

HSI1CLK, PLLCLK and HSECLK can be selected as system clock; the clock source of PLLCLK can be one of HSI1CLK and HSECLK; the required system clock can be obtained by configuring PLL clock multiplier factor and frequency dividing coefficient.

When the product is reset and started, HSI1CLK is selected as the system clock by default, and then the user can choose one of the above clock sources as the system clock by himself. When HSECLK failure is detected, the system will automatically switch to the HSI1CLK, and if an

interrupt is enabled, the software can receive the related interrupt.

4.5.3. Bus clock

AHB, APB1 and APB2 are built in. The clock source of AHB is SYSCLK, and the clock source of APB1 and APB2 is HCLK; the required clock can be obtained by configuring the frequency dividing coefficient. The maximum frequency of AHB and high-speed APB2 is 120MHz, and the maximum frequency of APB1 is 60MHz.

4.6. Power supply and power management

4.6.1. Power supply scheme

Table 5 Power Supply Scheme

| Name | Voltage range | Instruction |
|------------------------------------|---------------|--|
| V _{DD} | 2.0~3.6V | I/Os (see pin distribution diagram for specific IO) and internal voltage regulator are powered through V _{DD} pin. |
| V _{DDA} /V _{SSA} | 2.0~3.6V | Power supply of ADC, DAC, reset module, RC oscillator and PLL analog part; when ADC or DAC is used, V _{DDA} shall not be less than 2.4V; V _{DDA} and V _{SSA} must be connected to V _{DD} and V _{SS} . |
| V _{BAT} | 1.8~3.6V | When V _{DD} is closed, RTC, external 32KHz oscillator and backup register are supplied through internal power switch. |

4.6.2. Voltage regulator

Table 6 Regulator Operating Mode

| Name | Instruction |
|----------------------|--|
| Master mode (MR) | Used in run mode |
| Low-power mode (LPR) | Used in stop mode |
| Power-down mode | Used in standby mode, when the voltage regulator has high impedance output, the core circuit is powered down, the power consumption of the voltage regulator is zero, and all data of registers and SRAM will be lost. |

Note: The voltage regulator is always in working state after reset, and outputs with high impedance in power-down mode.

4.6.3. Power supply voltage monitor

Power-on reset (POR) and power-down reset (PDR) circuits are integrated inside the product. These two circuits are always in working condition. When the power-down reset circuit monitors that the power supply voltage is lower than the specified threshold value (V_{POR/PDR}), even if the external reset circuit is used, the system will remain reset.

The product has a built-in programmable voltage regulator (PVD) that can monitor V_{DD} and compare it with V_{PVD} threshold. When V_{DD} is outside the V_{PVD} threshold range and the interrupt is enabled, the MCU can be set to a safe state through the interrupt service program.

4.7. Low-power mode

APM32E103xCxE supports three low-power modes, namely, sleep mode, stop mode and standby mode, and there are differences in power, wake-up time and wake-up mode among these three modes. The low-power mode can be selected according to the actual application requirements.

Table 7 Low Power Consumption Mode

| Mode | Instruction |
|--------------|--|
| Sleep mode | The core stops working, all peripherals are working, and it can be woken up through interrupts/events |
| Stop mode | Under the condition that SRAM and register data are not lost, the stop mode can achieve the lowest power consumption; The clock of the internal 1.3V power supply module will stop, HSECLK crystal resonator, HSICLK and PLL will be prohibited, and the voltage regulator can be configured in normal mode or low power mode; Any external interrupt line can wake up MCU, and the external interrupt lines include one of the 16 external interrupt lines, PVD output, RTC and USBD. |
| Standby mode | The power consumption in this mode is the lowest; Internal voltage regulator is turned off, all 1.3V power supply modules are powered off, HSECLK crystal resonator, HSICLK and PLL clocks are turned off, SRAM and register data disappear, RTC area and backup register contents remain, and standby circuit still works; The external reset signal on NRST, IWDG reset, rising edge on WKUP pin or RTC event will wake MCU out of standby mode. |
