测量和使用注意事项

MEASURING AND APPLICATION NOTICE

1. 测量

Measurement

请在以下条件下测量。

Please measure under the following conditions.

1.1. 标准大气条件

Standard atmospheric conditions

除非另有规定，所有试验和测量应按在IEC 60068-1的5.3规定的试验用标准大气条件下进行：

Unless otherwise specified, all tests and measurements shall be made under standard atmospheric conditions for testing as given in IEC 60068-1, 5.3:

表1. 标准大气条件
Table 1. Standard atmospheric conditions

温度 Temperature	相对湿度 Relative humidity	气压 Air pressure
15°C~35°C	25%~75%	86kpa~106kpa

在进行测量之前，电容器应在测量温度下存放足够时间，以使整个电容器都达到这一温度。为此目的，规定与试验后恢复时间同样的时间，通常是足够的。

Before the measurements are made, the capacitor shall be stored at the measuring temperature for a time sufficient to allow the entire capacitor to reach this temperature. The period as prescribed for recovery at the end of a test is normally sufficient for this purpose.

在标准大气条件下进行测量，其测量结果存在争议时应采用仲裁温度（见1.3）重复测量。

Test and measurement shall be made under standard atmospheric conditions for testing, in the event of a dispute, the measurements shall be repeated using one of the referee temperatures (as given in 1.3).

当按某一顺序进行试验时，一个试验的最后测量可以作为下一试验的初始测量。

When tests are conducted in a sequence, the final measurements of one test may be taken as the initial measurements for the succeeding test.

在测量期间，不应使电容器受到气流、阳光直射或可能引起误差的其他影响。

During measurements the capacitor shall not be exposed to draughts, direct sunlight or other influences likely to cause error.

1.2. 恢复条件

Recovery conditions

除非另有规定，恢复应在试验用标准大气条件（见1.1）下进行。

Unless otherwise specified recovery shall take place under the standard atmospheric conditions for testing (1.1).

如果恢复必须在严格控制条件下进行，应采用IEC 60068-1中5.4.1的控制条件。

If recovery under closely controlled conditions is necessary, the controlled recovery conditions of 5.4.1 of IEC 60068-1 shall be used.

除非有关规范另有规定，恢复时间应为1h~2h。

Unless otherwise specified in the relevant specification, a duration of 1 h to 2 h shall be used.

1.3. 仲裁条件

Referee conditions

在仲裁情况下，应选用IEC 60068-1中5.2中规定的仲裁试验用标准大气条件。

For referee purposes, one of the standard atmospheric conditions for referee tests taken from 5.2 of IEC 60068-1, as given in table 1 below, shall be selected:

表2. 仲裁条件
Table 2. Referee conditions

温度 Temperature	相对湿度 Relative humidity	气压 Air pressure
24°C~26°C	48%~52%	86kpa~106kpa

2. 工作电压

Operating voltage

在交流电路或纹波电路中使用直流额定电压电容器时，请务必将外加电压的Vp-p值或包含直流偏置电压的Vo-p值维持在额定电压范围内。

When DC-rated capacitors are to be used in AC or ripple current circuits, be sure to maintain the Vp-p value of the applied voltage or the Vo-p which contains DC bias within the rated voltage range.

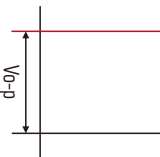

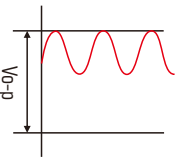

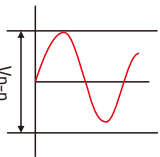

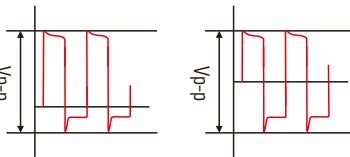

测量和使用注意事项

MEASURING AND APPLICATION NOTICE

若向电路施加电压，开始或停止时可能会因谐振或切换产生暂时的异常电压。请务必使用额定电压范围包含这些异常电压的电容器。

When the voltage is applied to the circuit, starting or stopping may generate irregular voltage for a transit period because of resonance or switching. Be sure to use a capacitor with a rated voltage range that includes these irregular voltages.

测量位置 Positional measurement				

3. 工作温度与自生热

Operating temperature and self-generated heat

适用于Hi-k类电容器

Apply to Hi-k type ceramic capacitors

电容器的表面温度应保持在额定工作温度范围的上限以下，务必考虑到电容器的自生热。

Keep the surface temperature of a capacitor below the upper limit of its rated operating temperature range. Be sure to take into account the heat generated by the capacitor itself.

电容器在高频电流、脉冲电流等中使用可能会因介电损耗发出自生热，所施加之正弦波电压的频率应低于300kHz。

When the capacitor is used in a high frequency current, pulse current or similar current, it may self-generate heat due to dielectric loss. The frequency of the applied sine wave voltage should be less than 300kHz.

外加电压应使自生热等负荷在25℃周围温度条件下不超过20℃范围。

The applied voltage load should be such that the capacitor's self-generated heat is within 20℃ in an atmosphere temperature of 25℃.

测量时应使用Ø0.1mm小热容量的(K)的热电偶，而且电容器不应受到其它元件的散热或周围温度波动影响(切勿在冷却风扇运转时进行测量。否则无法确保测量数据的精确性)。

When measuring, use a thermocouple of small thermal capacity-K of Ø0.1mm in conditions where the capacitor is not affected by radiant heat from other components or surrounding ambient fluctuations (Never attempt to perform measurement with the cooling fan running. Otherwise, accurate measurement cannot be ensured.).

过热可能会导致电容器特性及可靠性下降。

Excessive heat may lead to deterioration of the capacitor's characteristics and reliability.

使用低损耗电容器之前，一定要仔细阅读第4项的说明。

Before using the low loss type ceramic capacitors, be sure to read the instructions in item 4.

4. 在施加高频和高电压过程中的负荷降低与自生热

Load reduction and self-generated heat during application of high-frequency and high-voltage

由于低损耗电容器所具有的低自生热特性，此类电容器的允许电功率一般均高于Y5P特性电容器。但是，在峰间幅值等于电容器额定电压的高频电压条件下，当自热温度达到20℃时，电容器的功率消耗会超过其允许电功率。Due to the low self-heating characteristics of low loss type ceramic capacitors, the allowable electric power of these capacitors is generally much higher than that of Y5P characteristic capacitors. However, in case the self-heating temperature is 20℃ under a high-frequency voltage whose peak-to-peak value equals the capacitor's rated voltage, the capacitor's power consumption may exceed its allowable electric power.

因此，在将SL特性/低损耗系列电容器用在频率为1kHz或以上的高频高压电路中时，应确保包括直流偏压在内的Vp-p值不超过表4所规定之施加电压值。同时，还应确保25℃周围温度条件下的自生热温度(电容器表面温度与电容器周围温度之间的温度差)不超过表4所规定的温度值。

Therefore, when using the SL characteristic / low loss series in a high-frequency and high-voltage circuit with a frequency of 1kHz or higher, make sure that the Vp-p values including the DC bias, do not exceed the applied voltage value specified in Table 4. Also make sure that the self-heating temperature (the difference between the capacitor's surface temperature and the capacitor's ambient temperature) at an ambient temperature of 25℃ does not exceed the value specified in Table 4.

Table 4. Allowable Conditions at High frequency

系列 Series	温度特性 Temperature characteristic	直流额定电压 DC rated voltage	高频时允许条件 High-freq. allowable conditions		电容器周围温度 Capacitor's ambient Temp.

			1000Vp-p	5°C max	
		2kV	1400Vp-p	20°C max	
			2000Vp-p	5°C max	
		3.15kV	1600Vp-p	20°C max	
			3150Vp-p	5°C max	
TC	SL	1kV	1000Vp-p	5°C max	
		2kV	2000Vp-p	5°C max	
		3.15kV	3150Vp-p	5°C max	
		6.3kV	6300Vp-p	5°C max	

由于受谐波影响, 当外加电压为矩形或脉冲波电压(非正弦波电压)时, 电容器的自生热会高于以相同的基础频率施加之正弦波电压所获得的温度值。

Because of the influence of harmonics, when the applied voltage is a rectangular wave or pulse wave voltage (instead of a sine wave voltage), the heat generated by the capacitor is higher than the value obtained by application of the sine wave with the same fundamental frequency.

为了参考作粗略计算, 矩形波或脉冲波的容许电压大致等于基础频率的2倍正弦波允许电压。但是, 该允许电压随电压和电流波形的不同而有所变化。

Roughly calculated for reference, the allowable voltage for a rectangular wave or pulse wave corresponds approximately to the allowable voltage for a sine wave whose fundamental frequency is twice as large as that of the rectangular wave or pulse wave. This allowable voltage, however, varies depending on the voltage and current waveforms.

因此, 您一定要确保自生热温度不高于表4所规定的温度值。

Therefore, you are requested to make sure that the selfheating temperature is not higher than the value specified in Table 4.

5. 耐电压的测试条件

Test condition for withstanding voltage

5.1. 测试设备

Test equipment

交流耐压的测试设备应具有能够产生类似于50/60Hz正弦波的性能。如果施加变形的正弦波或超过规定电压值的过载电压后, 则可能会导致故障。

Test equipment for AC withstanding voltage should be used with the performance of the wave similar to 50/60Hz sine wave. If the distorted sine wave or overload exceeding the specified voltage value is applied, a defect may be caused.

5.2. 电压外加方法

Voltage applied method

使用耐电压时, 电容器的引线或端子应对耐电压测试设备的输出端连接牢固; 然后再将电压从近零增加到测试电压。

When the withstanding voltage is applied, capacitor's lead or terminal should be firmly connected to the output of the withstanding voltage test equipment, and then the voltage should be raised from near zero to the test voltage.

如果测试电压不从近零逐渐提高而是直接施加在电容器上, 则施加时应包含过零点。测试结束时, 测试电压应降到近零; 然后再将电容器引线或端子从耐电压测试设备的输出端取下。

If the test voltage without the raise from near zero voltage would be applied directly to capacitor, test voltage should be applied with the zero cross. At the end of the test time, the test voltage should be reduced to near zero, and then capacitor's lead or terminal should be taken off the output of the withstanding voltage test equipment.

如果测试电压不从近零逐渐提高而是直接施加在电容器上, 则可能会出现浪涌电压, 从而导致故障。

If the test voltage without the raise from near zero voltage would be applied directly to capacitor, the surge voltage may arise, and therefore, a defect may be caused.

过零点是指电压正弦通过0V的位置。参见右图。

ZERO CROSS is the point where voltage sine wave passes 0V. See figure at right.

6. 失效安全性

Fail-safe

电容器损坏时，失效可能会导致短路。为了避免在短路时引起触电、冒烟、火灾等危险情况，请在电路中使用熔丝等元件来设置自动防故障功能。

When capacitor would be broken, failure may result in a short circuit. Be sure to provide an appropriate fail-safe function like a fuse on your product if failure would result in an electric shock, fire or fuming.

7. 电容器容量变化

Capacitance change of capacitors

电容量可能会因环境温度或外加电压而发生轻微变化。若要将其用于严格的时间常数电路，请与我公司联系。
Capacitance might change a little depending on a surrounding temperature or an applied voltage. Please contact us if you use for the strict constant time circuit.

Hi-k类电容器具有老化特性；因此，电容器若长时间使用，其电容量会逐渐降低。而且，电容量还可能会因环境温度或外加电压而发生巨大变化。所以不适合用于时间常数电路。

Hi-k type ceramic capacitors have an aging characteristic, whereby the capacitor continually decreases its capacitance slightly if the capacitor is left on for a long time. Moreover, capacitance might change greatly depending on the surrounding temperature or an applied voltage. So, it is not likely to be suitable for use in a constant time circuit.

若需详情，请与我公司联系。

Please contact us if you need detailed information.

8. 使用设备进行性能检查

Performance check by equipment

使用电容器之前，请先检查设备的性能和特性没有问题。

Before using a capacitor, check that there is no problem in the equipment's performance and the specifications.

一般而言，Hi-k类电容器的电容量具有电压相关特性和温度相关特性。所以，其电容值可能会随设备的工作条件而发生变化。因此，一定要确认仪器接收性能对电容器的静电容量值变化的影响，如漏电流和静噪特性。

Generally speaking, Hi-k type ceramic capacitors have voltage dependence characteristics and temperature dependence characteristics in capacitance. So, the capacitance value may change depending on the operating condition in the equipment. Therefore, be sure to confirm the apparatus performance of receiving influence in the capacitance value change of a capacitor, such as leakage current and noise suppression characteristic.

此外，必要时还要检查电容器在设备中的防电涌性能，因为通过电路的感应，浪涌电压可能会超过规定值。

Moreover, check the surge-proof ability of a capacitor in the equipment, if needed, because the surge voltage may exceed specific value by the inductance of the circuit.

贮存条件

STORAGE ENVIRONMENT

电容器绝缘包封层不是完美的密封形式，因此，请勿将电容器存放在腐蚀性气体中，尤其是存在氯气、硫气、酸、碱、盐等场所，同时应防潮。

The insulating coating of capacitors does not form a perfect seal; therefore, do not use or store capacitors in a corrosive atmosphere, especially where chloride gas, sulfide gas, acid, alkali, salt or the like are present. And avoid exposure to moisture.

电容器应存放在温度及相对湿度分别不超出-10℃~40℃及15%~70%范围的场所。请在6个月内使用电容器。

Please confirm there is no influence of holding measures on the product with the intended equipment.

1. 焊锡

Soldering

当在PCB/PWB焊锡这个产品时，不要超过电容器的焊锡耐热性标准。过度的热量会使电容器内部焊锡熔化，可能导致热冲击而使陶瓷介质出现暗裂。When soldering this product to a PCB/PWB, do not exceed the solder heat resistance specifications of the capacitor. Subjecting this product to excessive heating could melt the internal junction solder and may result in thermal shocks that can crack the ceramic element.

当使用烙铁进行手工焊锡时，应该遵照下列条件：When soldering capacitor with a soldering iron, it should be performed in the following conditions.

焊锡温度：320°C最大

Temperature of iron-tip: 320°C. max.

烙铁头：不超过40W

2. 压焊、树脂涂层与包封

Bonding, resin molding and coating

在压焊、树脂涂层和封膜之前，请先使用指定设备确认对产品没有影响，然后再进行使用。

Before bonding, molding or coating this product, verify that these processes do not affect the quality of capacitor by testing the performance of the bonded, molded or coated product in the intended equipment.

在粘合、树脂涂层、封膜的干燥、硬化条件使用到有机溶剂（乙酸乙酯、甲基乙酮、甲苯等），可能会破坏电容器的包封树脂，而造成短路不良。

In case the amount of applications, dryness / hardening conditions of adhesives and molding resins containing organic solvents (ethyl acetate, methyl ethyl ketone, toluene, etc.) are unsuitable, the outer coating resin of a capacitor is damaged by the organic solvents and it may result, worst case, in a short circuit.

粘合、树脂涂层、封膜厚度的偏差可能会在冷却与加热过程中使电容器的包封树脂和/或陶瓷介质破裂。

The variation in thickness of adhesive, molding resin or coating may cause outer coating resin cracking and/or ceramic element cracking of a capacitor in a temperature cycling.

3. 清洗（超声波清洗）

Cleaning (ultrasonic cleaning)

要进行超声波清洗，应遵守下列条件。

To perform ultrasonic cleaning, observe the following conditions.

清洗槽容量：每升输出功率20瓦特或以下。

Rinse bath capacity: Output of 20 watts per liter or less.

清洗时间：最多5分钟。

Rinsing time: 5 min. maximum.

不得直接振动 PCB/PWB。

Do not vibrate the PCB/PWB directly.

过度的超声波清洗会导致导线的过载损坏。
