	<ul> <li>APPLICATION</li> <li>This specification is applied to ZAE series monolithic capacitor in accordance with AEC-Q200 requirements used for automotive electronic equipment.</li> <li>ZAE series monolithic capacitor has the following characteristics:</li> <li>Complies AEC-Q200 requirements</li> <li>Miniature size, large capacitance, tape and reel packaging suitable for auto-placement.</li> <li>Epoxy coating creates excellent performance in humidity resistance, mechanical strength and heat resistance.</li> <li>Standard size, various lead configurations.</li> <li>Comply with RoHS 2.0, reach, halogen-free available.</li> </ul>

No	Test Item		Specification	Test Method					
	Tensile Strength		Termination not to be broken or loosened.	As in the figure, fix the capacitor body, apply the force gradually to each lead in the radial direction of the capacitor until reaching 10N and then keep the force applied for $10\pm1$ seconds.					
18	18 Terminal Strength Bending Strength	Termination not to be broken or loosened.	Each lead wire should be subjected to a force of 2.5N and then be bent 90° at the point of egress in one direction. Each wire is then returned to the original position and bent 90° in the opposite direction at the rate of one bend per 2 to 3 seconds.						
19	Capacitance Charact	Temperature teristics	C0G: 25~125°C: 0±30ppm/°C -55~25°C: 0+30/-72ppm/°C X7R: Within ±15%	The $\Delta$ C/C should be measured after 5min. at each specified temperature step.Step12345Temp.25-552512525COGThe temperature coefficient is determined using the capacitance measured in step 3 as a reference. When cycling the temperature sequentially from step 1 through 5 (-55°C to 125°C) the capacitance should be within the specified tolerance for the temperature coefficient and capacitance change as table. The capacitance drift is calculated by dividing the differences between the maximum and minimum measured values in the step 1, 3 and 5 by the capacitance value in step 3.X7RThe ranges of $\Delta$ C/C compared with the above 25°C value over the temperature ranges shown in the table should be within the specified ranges.Pretreatment Perform the heat treatment at 150+0/-10°C for 60±5 min and then let sit for 24±2h at room condition. Perform the initial measurement					

#### 6. PACKING AND STORAGE

## 6.1. STORAGE ENVIRONMENT

The insulating coating of capacitors does not form a perfect seal; therefore, do not use or store capacitors in a corrosive atmosphere, especially where chloride gas, sulfide gas, acid, alkali, salt or the like are present. And avoid exposure to moisture. Before cleaning, bonding, or molding this product, verify that these processes do not affect product quality by testing the performance of a cleaned, bonded or molded product in the intended equipment.

Store the capacitors where the temperature and relative humidity do not exceed  $5 \sim 40^{\circ}$ C and  $20 \sim 70\%$ . Use capacitors within 6 months. For more than 6 months, confirm the solderability and capacitance before use.

## 6.2. MINIMUM PACKAGE QUANTITY

#### 7. CAUTION

## 7.1. OPERATING VOLTAGE

When DC-rated capacitors are to be used in AC or ripple current circuits, be sure to maintain the Vp-p value of the applied voltage or the Vo-p which contains DC bias within the rated voltage range. When the voltage is started to apply to the circuit or it is stopped applying, the irregular voltage may be generated for a transit period because of resonance or switching. Be sure to use a capacitor within rated voltage containing this irregular voltage.

	DOC NO.:	DEC-SA-WI010
Dersonic	REV.:	A/0
APPROVAL SPECIFICATIONS	DATE:	2022-07-07
FOR MONOLITHIC CAPACITORS (AEC-Q200 REV.)	PAGE:	9 / 10

When DC-rated capacitors are to be used in input circuits from commercial power source (AC filter), be sure to use Safety Recognized Capacitors because various regulations on withstand voltage or impulse withstand established for each equipment should be taken into considerations.

## 7.2. OPERATING TEMPERATURE AND SELF-GENERATED HEAT

Keep the surface temperature of a capacitor below the upper limit of its rated operating temperature range. Be sure to take into account the heat generated by the capacitor itself.

When the capacitor is used in a high-frequency current, pulse current or the like, it may have the self-generated heat due to dielectric-loss. In case of Class 2 capacitors (Temp. Char. : X7R), applied voltage should be the load such as self-generated heat is within  $20^{\circ}$ C on the condition of atmosphere temperature  $25^{\circ}$ C. Please contact us if self-generated heat is occurred with Class 1 capacitors (Temp. Char. : COG). When measuring, use a thermocouple of small thermal capacity-K of  $\emptyset$ 0.1mm and be in the condition where capacitor is not affected by radiant heat of other components and wind of surroundings. Excessive heat may lead to deterioration of the capacitor's characteristics and reliability.

#### 7.3. FAIL-SAFE

Be sure to provide an appropriate fail-safe function on your product to prevent a second damage that may be caused by the abnormal function or the failure of our product.

## 7.4. VIBRATION AND IMPACT

Do not expose a capacitor or its leads to excessive shock or vibration during use.

#### 7.5. SOLDERING

When soldering this product to a PCB/PWB, do not exceed the solder heat resistance specification of the capacitor. Subjecting this product to excessive heating could melt the internal junction solder and may result in thermal shocks that can crack the ceramic element.

Fig.: Wave-soldering temperature-time profile to recommend

When soldering capacitor with a soldering iron, it should be performed in the following conditions. Temperature of iron-tip:  $350^{\circ}$ C Max.

Soldering iron wattage: 40W max.

Soldering time: 3.0s Max.

## 7.6. BONDING AND RESIN MOLDING, RESIN COAT

In case of bonding, molding or coating this product, verify that these processes do not affect the quality of capacitor by testing the performance of a bonded or molded product in the intended equipment.

In case of the amount of applications, dryness / hardening conditions of adhesives and molding resins containing

	DOC NO.:	DEC-SA-WI010

FUR MUNULITHIC CAPACITURS (AEC-Q200 REV.)	PAGE:	10 / 10		
organic solvents (ethyl acetate, methyl ethyl ketone, toluene, etc.) are unsuitable, the outer coating resin of a capacitor				
is damaged by the organic solvents and it may result, worst case, in a short circuit.				
The variation in thickness of adhesive or molding resin may cause a outer coating resi	The variation in thickness of adhesive or molding resin may cause a outer coating resin cracking and/or ceramic			
element cracking of a capacitor in a temperature cycling.				
7.7. TREATMENT AFTER BONDING AND RESIN MOLDING, RESIN COAT				
When the outer coating is hot (over 100 $^\circ \! \mathbb{C}$ ) after soldering, it becomes soft and fragile	When the outer coating is hot (over 100 $^\circ\mathrm{C}$ ) after soldering, it becomes soft and fragile.			
So please be careful not to give it mechanical stress.				
Failure to follow the above cautions may result, worst case, in a short circuit and cause fuming or partial dispersion				
when the product is used.				
7.8. LIMITATION OF APPLICATIONS				
Please contact us before using our products for the applications listed below which require especially high reliability for				
the prevention of defects which might directly cause damage to the third party's life, body or property.				
Aircraft equipment				
Aerospace equipment				
Undersea equipment				
Power plant control equipment				
Medical equipment				
Iransportation equipment (vehicles, trains, ships, etc.)				
■ Iraffic signal equipment				
Disaster prevention / crime prevention equipment				
Data-processing equipment exerting influence on public				
Application of similar complexity and/or reliability requirements to the application	s listed in th	ie above.		
8.1. CLEANING (ULI KASUNIC CLEANING)				
To perform ultrasonic cleaning, observe the following conditions.				
Rinse bath capacity : Output of 20 waits per liter of less.				
Rillsling unite : 5 milli maximum.				
Du liui vibiate tile FGD/FWD ullectiy.				
excessive unrasonic cleaning may lead to rangue destruction of the lead whes.				
Insertion of the Load Wire				
When soldering insert the load wire into the PCR without mechanically stressing	the lead wir	0		
<ul> <li>When soluting, insert the lead when hit the FOD without mechanically successing</li> <li>Insert the lead wire into the PCB with a distance appropriate to the lead space</li> </ul>		σ.		
8 3 CAPACITANCE CHANCE OF CAPACITORS				
$\blacksquare  \text{Class 2 canacitors (Temp. Char. , X7R)}$				
Class 2 capacitors an aging characteristic whereby the capacitor continually dec	reases its ca	anacitance slightly if		
the capacitor leaves for a long time. Moreover, capacitance might change greatly	denending o	n a surrounding		
temperature or an applied voltage. So it is not likely to be able to use for the time	constant ci	rcuit		
Please contact us if you need a detail information.				
9. NOTE				

# 1) Please make sure that your product has been evaluated in view of your specifications with our product being mounted to your product.

2) You are requested not to use our product deviating from this specification.
