

Rapid Charge™ AC/DC Digital Quasi-Resonant PWM Controller

1 Description

The iW1780 is a high performance AC/DC power supply controller for rapid charge that uses digital control technology to build peak-current mode PWM flyback power supplies. The device operates in quasi-resonant mode to provide high efficiency and a number of key built-in protection features. The iW1780 can achieve tight multi-level constant voltage and multi-level constant current regulation without a traditional secondary-feedback circuit. It also eliminates the need for loop compensation components while maintaining stability over all operating conditions.

The iW1780 is optimized to work with Dialog's secondary-side controller for Qualcomm® Quick Charge™ 2.0 (QC2.0) interface and secondary-primary communication, iW626, to achieve fast and smooth voltage transition upon request by portable devices (PD). When paired with the iW626, the iW1780 eliminates the discrete decoders on the primary side, minimizes the external component count and simplifies system designs. The iW626 can communicate with the iW1780 through one optocoupler for all the necessary rapid charge information including output voltage requests, output current limits, output voltage undershoot and output over-voltage.

Dialog's innovative proprietary technology ensures that power supplies designed with the iW1780 and iW626 can provide 5V/9V/12V output voltage configuration, with user-selected various output current limit combinations.
