Brief Description

- WF200D is a high precision barometer timer especially designed for consumer applications. It measures the pressure based on piezo-resistive MEMS pressure sensor.
- Optimized for ultra-low power and low voltage for use in mobile phones, smart watches, PDAs, GPS navigation devices and outdoor equipment.
- The sensor module is housed in a compact 16-pin SOIC package with a footprint of only 10.3 × 10.3 mm and 10.3 mm package height. Its small dimensions and its low power consumption allow the implementation in battery driven devices. With a low altitude noise of merely 0.08m and very low offset temperature coefficient(TCO), the offers superior performance and cost are perfectly suitable for applications like flying toys and sport watches.
- The IIC/SPI interface allows for easy system integration with a microcontroller.

I2C INTERFACE

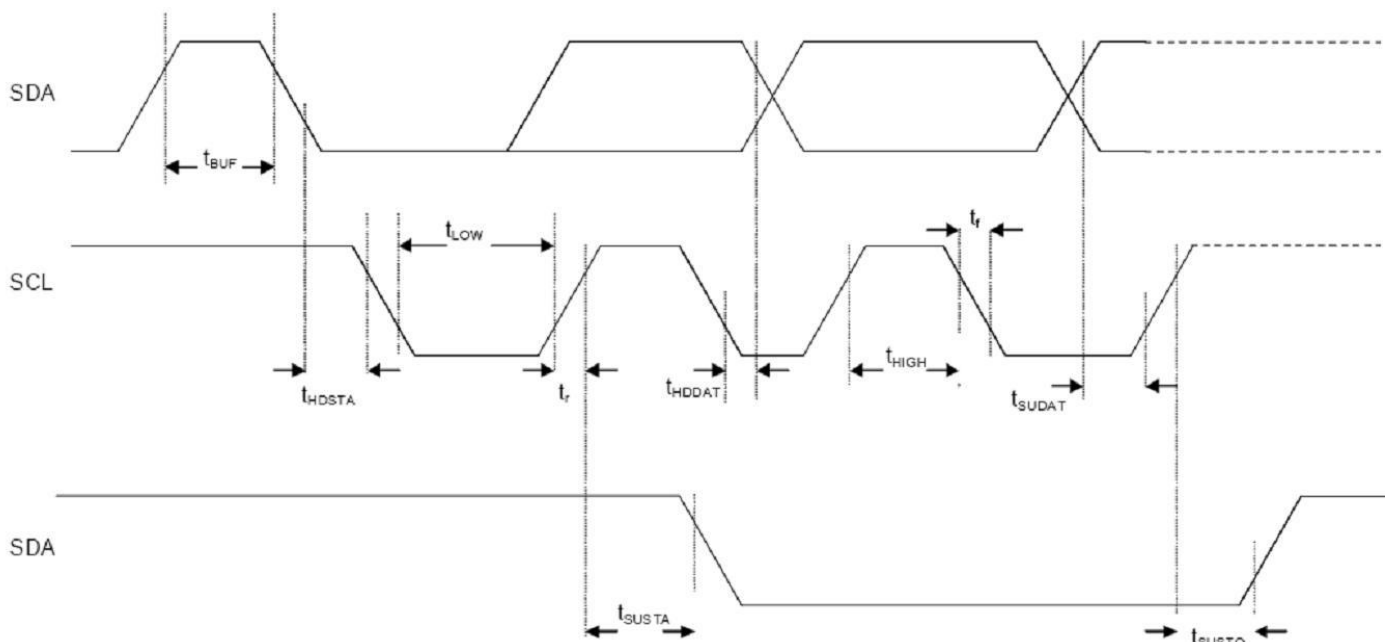

I2C bus uses SCL and SDA as signal lines. Both lines are connected to VDDIO externally via pull-up resistors so that they are pulled high when the bus is free. The I2C device address of is shown below. The LSB bit of the 7bits device address is configured via SDO/ADDR pin.

IIC Device Address

	Device Address							IIC W/R
	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Default	1	1	0	1	1	0	1	0/1
Custom	1	1	0	1	1	0	SDO/ADDR	0/1

WF200DPZ 0.1BG S16 DT Digital Pressure Sensor

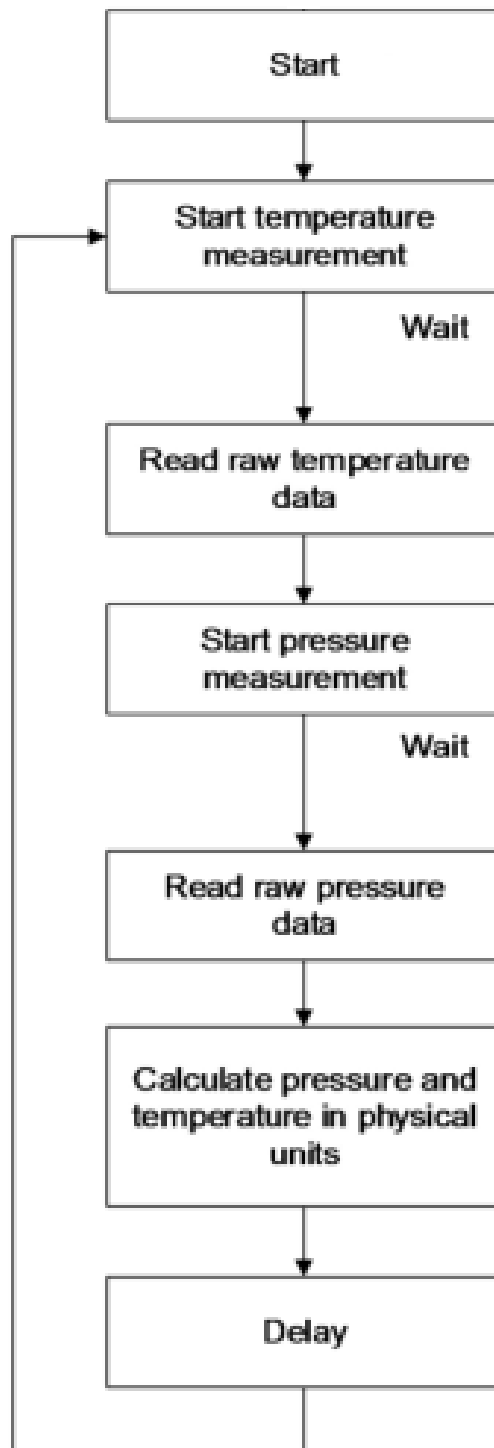

The I2C interface protocol has special bus signal conditions. Start (S), stop (P) and binary data conditions are shown below. At start condition, SCL is high and SDA has a falling edge. Then the slave address is sent. After the 7 address bits, the direction control bit R/W selects the read or write operation. When a slave device recognizes that it is being addressed, it should acknowledge by pulling SDA low in the ninth SCL (ACK) cycle. At stop condition, SCL is also high, but SDA has a rising edge. Data must be held stable at SDA when SCL is high. Data can change value at SDA only when SCL is low.
