## ■ Performance Characteristics

### Power Derating Curve

The Operating Temperature Range: -65°C ~+170°C.

Terminal temperatures above 70°C, power rating must be derated in accordance with the curve as below :

## ■ Rating Current

The following equation may be used to determine the DC (Direct Current) or AC (Alternating Current) (RMS, root mean square value) of normal rated power. However, if the result value exceeds the highest current of regulated standards, the highest normal rated power is to be used

$$I = \sqrt{P/R}$$

I = Rating current (A)  
P= Rating Power (W)  
R= Resistance(Ω)

## ■ Marking Format:

- 1206 no marking.
- 2512/3920/5930 marking are 3 digits.
- “L” designates the decimal location in milliohm  
e.g. 3mΩ the product marking is 3L0.  
0.3mΩ the product marking is L30.
- The criteria to distinguishing the mark on the surface of products are that characters can be identified.

● Note : All Reliability test should follow De-rating curve , terminal temperature of component should be below 70°C.

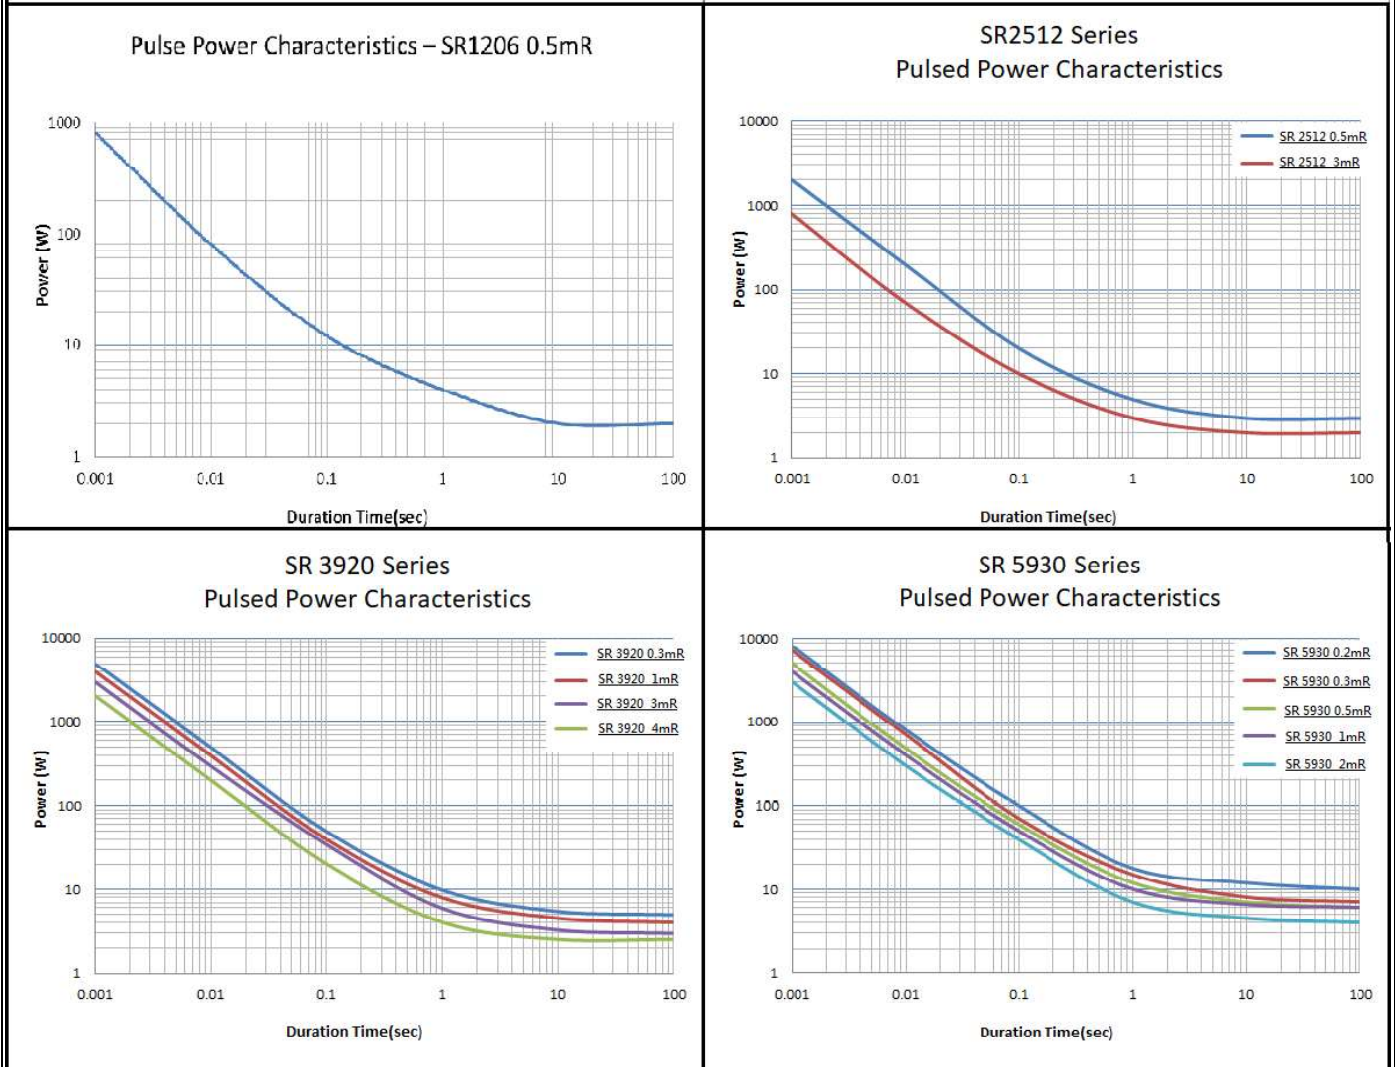

● Note : Footprint size, solder insufficient, excessive solder, solder void and component shifted will affect the resistance accuracy after IR reflow. Circuit calibration is a must to be done by functional test.
